In about two weeks the Wisconsin Telephone company will announce its new schedule of rates for Milwaukee. It reduced rates in the rest of the state a number of weeks ago and has promised to modify its rates in Milwaukee by July 1st. It is by no means certain that the company will make a general reduction in its rates here. What it is likely to do is to divide its patrons into classes and establish different rates for different classes, according to the number of calls. The idea of this plan, of course, would be to make the actual service rendered the basis of the rates.

Several mass meetings of persons interested in getting lower telephone rates have been held of late, and at one time it looked as though the company was going to have trouble. The most formidable movement originated on the South Side, where a meeting attended by a number of business men was held and resolutions calling for lower rates were adopted. The resolutions recited that the telephone rates in Milwaukee were higher than those in any other city of its size in the United States; that the rates have not been reduced notwithstanding the reduction in wages and in the prices of commodities; that an attempt to have the Legislature fix telephone rates had failed, and that the company had promised to reduce its rates in Milwaukee, but had not done so. The resolutions concluded with a protest against the present rates, which were pronounced exorbitant, and declared in favor of a mass meeting of all the telephone subscribers in the city at the Academy of Music at an early day, to the end that at least as favorable rates as other cities enjoyed might be obtained.

The agitation, however, received a setback at the hands of the Merchants and Manufacturers' association, which had previously demanded lower telephone rates. Manager Wilkins of the association announced that in March, when a committee of the association waited upon the telephone people in the interest of the movement to get lower rates; the officers of the company had assured the committee that the company would reduce rates as soon as possible, not later than July 1st. "The officers of the company are honorable men," said Manager Wilkins, "and no doubt will do as they say as soon as possible. The work of preparing a new schedule is difficult, involving the outlay of several thousand dollars, and it is only reasonable to give the company time to make the reduction that it has promised. The association cannot join in the proposed mass meeting until it knows just what reductions the company proposes to make; if the reductions are not generally satisfactory, then it will be time enough for the Merchants and Manufacturers' association to act."

At this time arrangements had been made to hold a mass meeting in the Academy of Music last Saturday evening, but a few days before the date of that meeting, it was announced that owing to the absence of one of the chief agitators, the meeting had been indefinitely postponed. The movement had not been abandoned, it was said, but would be revived as soon as necessary, the idea conveyed being that nothing would be done before the company announced its decision regarding rates.

At the last meeting of the county board of supervisors a resolution was adopted ordering the Wisconsin Telephone company to take out all telephones used by the county, except one in each of the county institutions, the intention being to put in private lines connecting the several offices.

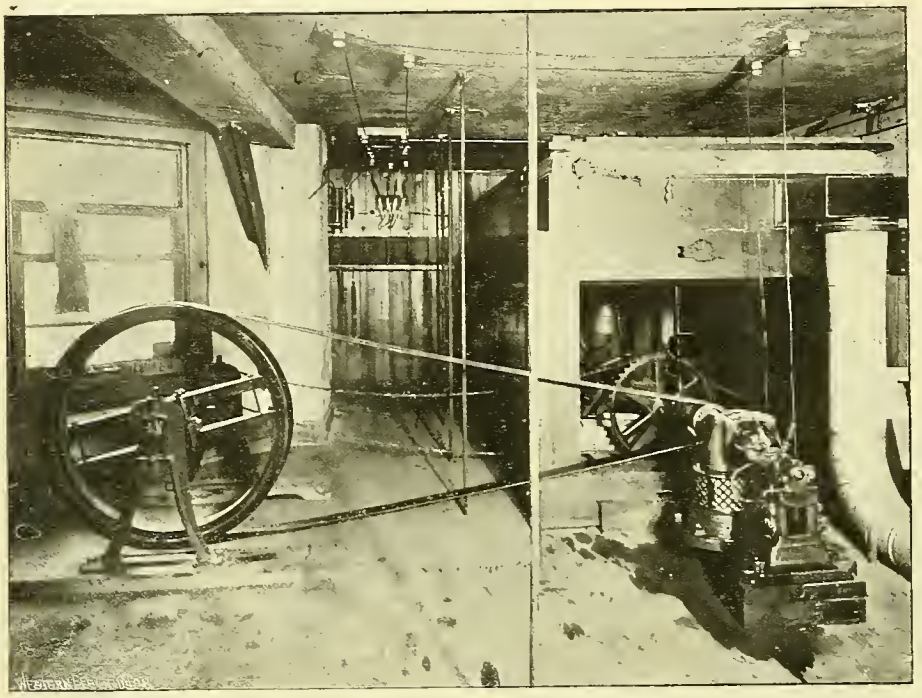

FIG. 5. STEINWAY HALL, CHICAGO, AND ITS ELECTRIC ORGAN.—BELLOWS MOTOR AND STORAGE BATTERY.

## Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

Sioux City, Ia., is about to become a storm center of telephonic activity. Heretofore the Iowa Union Telephone company has rented 25 instruments to the city at one-half the regular rates. When the new Home Telephone company secured its franchise it was with the proviso that 21 telephones be furnished the city free. This company will have its exchange in operation very soon now, and the aldermen have drawn a notice of cancellation of the contract with the Iowa Union, taking effect at midnight, June 30th, at which time the new company's instruments will be in. The loss of connections with fire and police departments would be a severe blow to the Iowa Union, so they will offer free use of all telephones now in the public buildings. The fight will be carried into the council, but will not begin until the notice is formally served.

The Standard Telephone & Electric company of Madison, Wis., is crowded with orders. It has recently received orders for 500 instruments in Ishpeming, Mich., shipped samples to Eureka Springs, Ark., is negotiating with the Western Electric Telephone company of Sumner, Ia., for 10,000 instruments for several toll lines and exchanges in Iowa. The company has unfilled orders in Iowa alone for over 2,000 telephones. Inquiries are coming from all over the country, and bids for branches of the factory have been received from New York, Chicago and Philadelphia, and from San Francisco, Portland and other western cities.

The Blue Earth Valley Telephone company of Winnebago City, Minn., is considering putting in a line to Fairmount, Minn.

# BERLINER OPINION.

## Grounds Upon Which the Patent Was Declared Valid.

[Special Correspondence of the WESTERN ELECTRICIAN.]

BOSTON, June 15.—The opinion of the United States Circuit Court of Appeals in the case of the American Bell Telephone company et al., appellants, versus the United States, appellees, in which the validity of the Berliner patent is involved, was filed June 14th, at 4 P. M. Judge Putnam wrote the opinion, the result of the decision being that the degree of the Circuit Court, Judge Carpenter, is reversed and the case remanded to that court with direction to dismiss the bill. The opinion says:

This is a bill in equity, filed February 9, 1893, touching a patent issued November 17, 1891, to the American Bell Telephone company, as assignee of Berliner. The alternative prayer is that the patent be in all things recalled, repealed and decreed absolutely null, but that, if the patent is not deserving to be wholly repealed, but is repealable in part, a decree be made repealing only such part as the court shall deem to be repealable. As to the latter part of this alternative prayer for relief, the court has heard nothing, and there is no occasion to consider it.

The bill contains enough on its face and in its frame and in its signature by the attorney-general to bring it within the United States against the American Bell Telephone company, 128 U. S., 351; but in the development of the proofs all allegations of affirmative or positive fraud dropped out, so United States versus American Bell Telephone company fails to reach the merit of the cause at bar. Berliner's original application was filed June 4, 1877, and patent 463,569 was issued more than fourteen years thereafter. This patent is sufficiently described for the purposes of this case by saying in a general way that it covers the microphone. In addition to this the American Bell Telephone company, as assignee of Berliner, holds, or held, a patent issued to Berliner November 2, 1880, numbered 233,969. It is represented that the patent of November 2, 1880, was a divisional one growing out of the same original application which supports patent 463,569. It is also represented that this patent covers the invention described and claimed in patent 463,569, under such circumstances that the latter comes within Miller versus Eagle Manufacturing company, 151 U. S., 186.

The pith of the case, as stated briefly by the counsel for the United States, is: (1) That patent 463,569 is void for illegal delay in its issue; (2) that it is also void on the ground that the prior patent, 233,969, "was granted upon the same application to the same applicant for the same invention."

So far as the law is concerned the patent in suit is to be tested independently of the Bell patent. There can be but one law touching alleged delays in the progress of an application through the Patent Office, and touching the duty of applicants in reference thereto, whether the invention was from the outset seen to be valuable, or only afterward proves to be so, or always remains of little account. To deny this is to deny that the laws are equal, and would furnish a standard for the determination of the rights of patentees too fickle and imaginative to form a proper basis for the use of a court of law. Therefore we have not set out these allegations as proper portions of the bill, and dot not deem it necessary to make further explanations in reference to them.

The following extracts from the answer of the American Bell Telephone company sufficiently illustrate its defense on this point:

> The respondent and said Berliner, in the initiation and in the prosecution of the application which resulted in said patent, and in all the proceedings with relation thereto, in all respects conformed to and complied with the various requirements of law in such case made and provided, did nothing which in law, justice or good conscience they ought not to have done, and omitted nothing which in law, justice or good conscience they ought to have done. All their respective statements and representations were intended by them, and were believed by them respectively to express the truth; they disclosed and communicated to the Patent Office everything which it was their duty to disclose or communicate; they did not conceal or attempt to conceal from any official of the Patent Office anything which they were bound to communicate or which they believed it was material for him to know; they did not deceive or mislead any such official, nor did they attempt or intend so to do; they did not take advantage of the ignorance of any official nor attempt to do so, nor did they profit by any such ignorance or seek to. They did not commit any abuse of process, proceedings or forms of law, nor contrive, attempt nor intend to do so, and were not guilty of any fraud, concealment, imposition or false suggestion whatever. They did not practice nor attempt to practice any fraud, deceit, suppression or subterfuge, but in all respects conformed to law and to the highest good faith and honesty.
>
> Whether Berliner's application was pending for a longer time than was necessary or proper this respondent is not sufficiently informed to fully deny or admit, and therefore requires the plaintiff to produce proof thereof if material. But this respondent did not designedly, with intent to postpone the expiration of said patent and its rights thereunder, delay or prolong the pendency of the application, nor do any act tending to that end. Neither the pendency nor the progress of the application, nor the issue of the patent in suit, were delayed by any act, omission or slowness of either respondent. It never omitted to take promptly every action which it was incumbent on it to take, or the taking of which it believed would hasten that issue. It never failed to prosecute the same promptly, and it used every means known to the law to speed the application, including applications to the commissioner in person as often as they seemed likely to result in speeding the case. It avers that the slowness alleged in the bill was the act of the plaintiff itself; neither respondent in any way contributed thereto by act or omission: neither such delay, nor any action, inaction or slowness which caused it, or contributed to it was in any way aided, promoted, due to, desired, intended, designed, contrived countenanced, acquiesced in, or connived at, by either of the respondents; and neither of them is responsible therefor, nor for the consequences and results thereof.

To the answer application was duly filed and proofs taken. The cause was heard in the Circuit Court and there decided in favor of the United States on each of the points we have briefly stated as being issues in the cause, from which appeal was duly taken to this court.

The case has been so thoroughly argued here on either side that the court has found little difficulty in apprehending it. We deem it imprudent to refrain from determining ulti-

mately any questions of fact except so far as we find it necessary so to do in order to apply the rules of law to it. The bill alleges, in portions of it which we have cited, that Berliner's application was abandoned at one stage of the proceedings. In order to correctly estimate the issue under discussion it is necessary to note that this is not now relied on. The United States has somewhat variously stated its opposition, and our first duty is to understand precisely what it is. In the very lucid and careful opinion of the learned judge who heard this case in the Circuit Court it is given in the following langnage:

The proposition is that the Bell company intentionally delayed the prosecution of the Berliner application and the issue of the Berliner patent, for the purpose and with the result of prolonging their control of the art of telephony, which would cease with the expiration of the Bell patent in 1893; and that they did this by submitting to delays on the part of the officers of the Patent Office, which delays they, the Bell company, had it in their power to prevent and refrained from preventing for an unlawful purpose. This conduct is alleged to constitute a fraud practiced upon the public through the commissioner of patents and his assistants, and it is claimed that the patent so obtained by such fraud may be and should be annulled by the decree of the court on the authority of United States versus American Bell Telephone company, 128 U. S., 315, because there is no substantial difference between a fraud practiced upon the commissioner as an agent of the public, and a fraud practiced on the public with the commissioner's connivance or acquiescence.

This is far from precise. It uses the words "intentionally delayed," while it necessarily conceded that there is no evidence to support that expression in its natural sense, and that the case comes down to a claim that the American Bell Telephone company submitted to delays which it was in its power to prevent. The statement continues that it refrained from preventing for an unlawful purpose. The "unlawful purpose" is understood to mean that it expected that its monopoly would be extended through the delays on the part of the Patent Office. This in some respects it might well regard as advantageous; but to undertake to lay down a rule of law, or a fact that acquiescence in the delay of a public official who is bound to perform a certain act, involves an unlawful purpose because it may result to the advantage of the applicant, omits an important element. If the applicant is under no obligation touching the delay, there is no rule of law by which it can be said that because he may receive an incidental benefit therefrom, his purpose in relation thereto is unlawful. A man's motives will not make wrongful an act which, in itself, is not wrongful.

The proposition further states that there is no substantial difference between a fraud practiced upon a commissioner which is an injury to the public, and one practiced on the public with the commissioner's connivance and acquiescence. This is probably a true statement of the law, because either hypothesis involves positive and affirmative fraud of a public character. But of this there is no claim whatever in the case at bar as it now stands. We must therefore look somewhere else for an accurate statement of the position of the United States.

At the hearing at bar the propositions were that the American Bell Telephone company owed the public some duty in the matter under consideration; and that duty is to be sought in the principle of legal ethics that every man is bound to enjoy his own in such a manner as not to interfere with a like enjoyment of their own by others; that if the exercise of the rights of the American Bell Telephone company under the Berliner application was liable to work injury to the public in a way foreseeable by the company, it was bound to take note of that fact, and conduct its proceedings in such a manner as to avoid that injury if possible; that if this situation imposed any duty on the American Bell Telephone company toward the public, it was a duty commensurate with the interests involved, and that no doctrine of reasonable diligence will reach the case unless reasonable diligence is held to be the utmost diligence, and that it owed the public an extraordinary duty in the matter, which could be discharged only by the greatest possible diligence on the prosecution of its application. It was further claimed that the delays set up in the bill were unwarrantable and illegal; that the attitude of the American Bell Telephone company toward them was not one of consent, but of interested consent, of acquiescence, of guilty connivance; that the commissioner was betraying his trust in permitting these delays; that it knew this, and knew the practical effect of what he was doing; and that it was its duty to stir the commissioner to action instead of refraining him from so doing. It was further said that if the American Bell Telephone company had bribed the commissioner for holding Berliner's application from year to year for the purpose of prolonging its monopoly this would plainly be a fraud on the public through the commissioner; but that to reach the same result by an intentional reliance, incapacity and neglect of duty, instead of his cupidity, and by conduct in keeping with such reliance, the same injury results to the public, with only the degree less of moral heinousness of behavior on the part of the applicant. We ought to say that all these epithets charging the commissioner or any other officer of the Patent Office with any conscious violation or neglect of duty or incapacity, are unsupported by the proofs in the case, unless it can be claimed that they constitute the language which the law applies in consequence of delays which possibly might have been prevented by the public official.

The United States having thus stated its position, we do not find ourselves required to recite the details of the proofs. It is enough to say that the case shows that all the allegations in the answer which we have quoted, are sustained, except only that we do not deem it necessary for the purposes of this case to determine fully the condition of the proofs on the proposition that there rested on the American Bell Telephone company an extraordinary duty to speed its application by every means known to the law, as alleged in the bill, or to exercise the greatest possible diligence, as claimed at the bar. Unless the case required this extreme diligence, there can be no just claim of an unlawful omission to act; and therefore there could not be the "unlawful purpose," because, as we have said, this does not result from a mere omission to do what the law does not require.

During the progress of the arguments the court anxiously looked for practical illustrations of what was meant by the high degree of diligence referred to, what practically could be done to satisfy its demands, and wherein, if accepted as necessary to relieve the applicant from the charge of the course of conduct unlawful or by implication fraudulent, it differed in its practical requirements from what was in fact done. The court failed to receive light in this direction; and it regards it as an answer to the proposition of the United States on this part of the case that what it did obtain was a mass of theoretical propositions, which, if applied practically, might or might not have involved the case, in its progress through the Patent Office, in greater complications and difficulties than those which did in truth surround it. In other words, so far as the proofs go, the course of the application was in accordance with the usages of that office, and was such as the officials there, acting in good faith and according

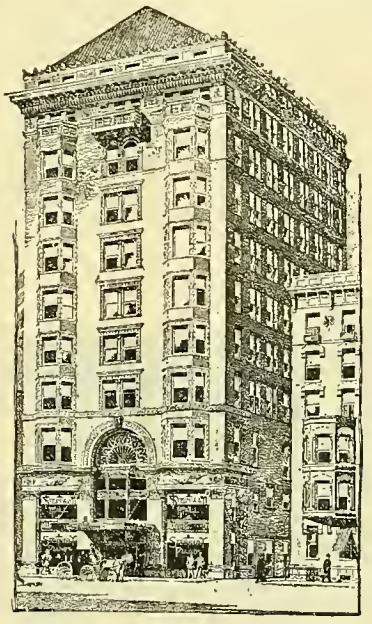

FIG. 2. STEINWAY HALL, CHICAGO, AND ITS ELECTRIC ORGAN.—EXTERIOR VIEW OF BUILDING.

to their practical experience, determined at the time to be on the whole the best. What would have been the practical result of the theoretical courses suggested, with an application around which centered so much powerful hostility as gathered about this one, it is impossible to ascertain by any methods of determination given to the courts. If, instead of suggesting theories as to what might have been done, the United States could have pointed out among the usages of the Patent Office an existing pathway other than that which was adopted, we would have some rule by which to estimate what could have been done in the exercise of extraordinary diligence other than was done.

One proposition of the United States illustrating generally what they say might have been done, we give in the exact terms stated to us at the bar:

The duty of the Bell company was to get its patent with the least possible delay by the exercise of all its legal rights. Whatever it had a right to do to expedite an application in its own interest, it was in this case bound to do in the public interest. If a situation arose in which the commissioner was not doing his duty, and in which it would have had a right to challenge his conduct in its own interest, it was its duty to challenge his conduct in the public interest. Its submission in silence to the delay directed by the commissioner in violation of his duty was a failure in the discharge of its duty.

In its own interest the American Bell Telephone company had a right to go to Congress for legislation touching the general course of proceedings in the Patent Office, as did the commissioner himself in 1889. It might have applied for the removal of subordinates for the purpose of substituting others who would attempt a more radical course of proceedings. It might have applied for the removal of the commissioner himself and the appointment of a successor who would have turned his energies more in the direction of forwarding the application under discussion. It might have applied to the commissioner for a general revision of the rules of practice of the Patent Office. The imagination can hardly put a limit to the things it had a right to do. To say, therefore, that it was bound to do in the public interest all that it had a right to do in its own, and that if it did not do this it should pay the penalty of a forfeiture of an invention said to be extremely valuable, is a proposition so unreasonable that the mere statement of it by the United States seems to confess the weakness of their case.

The court quotes from the bill a statement that the patent might have been put through had the Bell company made a fair, candid, and strong presentation of the facts, and adds:

This is a merely negative proposition, so far as it attempts to reach the defendant corporation, without specification and proofs. But the proposition is that there was on the part of these officials a gross dereliction of duty. Indeed, in the presentation of the case of the United States we have heard very much in censure of the public officials, clothed in the strongest epithets, of which we have already given some instances. We are compelled to say that if this record suggests any derelictions of official duty, it was in the form of a continued hostility to the American Bell Telephone company, and of an indisposition to grant the application for the Berliner microphone, with a concurrent disposition to nurse and favor the Drawbaugh application, either for its own direct advantage or for the purpose of defeating inventions controlled by the defendant corporation.

Notwithstanding, as we have already said, the proofs do not convict the officials, they show enough to have warranted the American Bell Telephone company in guarding itself against the possibility of such a disposition on their part during the period covered by the nine years between June 9, 1882, and the issuing of the patent now in dispute

* * *

Indeed, the whole tenor of the case of the United States, so far as it is supported by the proofs, has the appearance of requiring of the defendant corporation a degree of diligence and astuteness apparently greater than that which would be expected from other inventors.

Referring to the statement that the commissioner was not personally advised of the true relations of the application, and that the American Bell Telephone company was in fault for not bringing them to his attention, the court says:

The record shows beyond question that the Berliner and Edison application, which went hand in hand, had become so notorious that the knowledge of them permeated the Patent Office from the head to the foot, and that the contest against them by Drawbaugh was so vigorous that it was impossible that any person, from commissioner to examiner, should not have understood their importance.

* * * The practical summing up of all these various suggestions (of the United States) is that the American Bell Telephone company is in effect censured for not reforming both the practice and officials of the Patent Office. We think this demand is without parallel or precedent, that the case may justly be stated in this form, and that, when thus put, it shows itself so revolutionary as to require the legal mind to reject it on the mere statement.

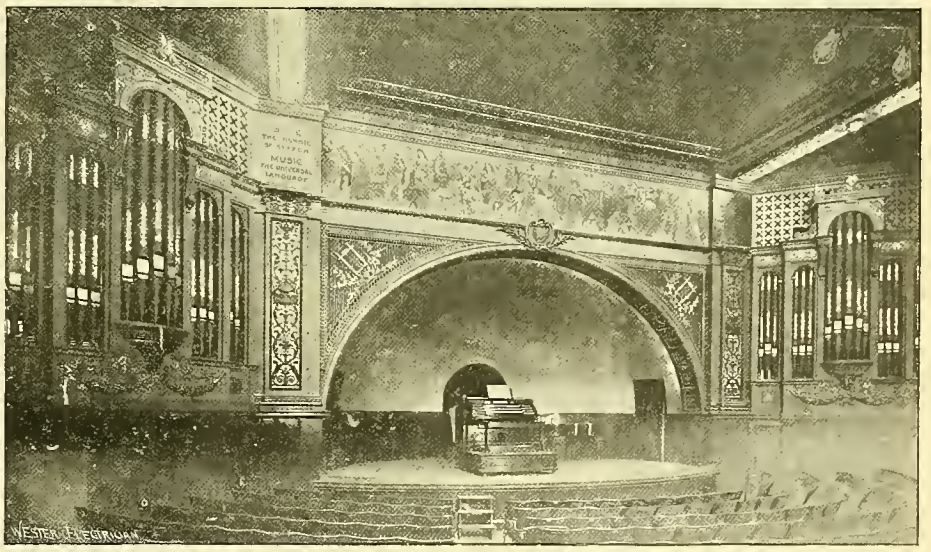

FIG. 3. STEINWAY HALL, CHICAGO, AND ITS ELECTRIC ORGAN.—MAIN AUDITORIUM.

The most that can be claimed by the United States is that the officials of the Patent Office, having all the law and facts before them, erred in the free exercise of their free judgment in the determination that the earlier patent did not cover the invention described and claimed in the later one. Even were this so, the result was not a mistake in the sense of the law in its application to the principles of cancellation of deeds and other instruments, but it was merely an erroneous judgment and determination of the ultimate fact deducted from the primary fact, all of which were known.

* * * The United States has filed a motion praying that if we find for the appellants we will reserve leave to the Circuit Court to permit an amendment at bar alleging that the American Bell Telephone company did directly agree with the representatives of the Drawbaugh application, that the determination by the Patent Office of the question of priority should abide the decision in the telephone cases, that these parties, acting in concert, did procure the

commissioner of patents to consent to such postponement, and thus that the American Bell Telephone company, by its own act, did procure the postponement of decision of priority, without necessity or right, in violation of its duty to speed the patent for the microphone.

We have already found that as the record now stands it contains no proof to sustain an allegation of this character. Therefore, an amendment of this nature would require the opening of the record below for further proofs. It is not at all a case where a complainant has proved his case, but his allegations are found by the appellate court to be inapt. To grant this motion would, under the circumstances, violate all the rules requiring diligence from parties complainant. The decree of the Circuit Court is reversed, and the case remanded to that court with directions to dismiss the bill.

## Madison's New Telephone Enterprise.

In view of the activity of the Standard Telephone & Electric company of Madison, Wis., it is evident that that concern contemplates taking an active part in the development of this new field of enterprise. The company finds much encouragement in the reception its system has thus far been accorded.

Mineral Point, Wis., Prairie du Chien, Wis., and Tomah, Wis., will soon have telephone exchanges and will use the Standard company's system. The Marquette County Telephone company of Michigan has also contracted with the Standard Telephone & Electric company for the first 500 telephones required for the exchanges at Ishpeming, Negaunee and Marquette.

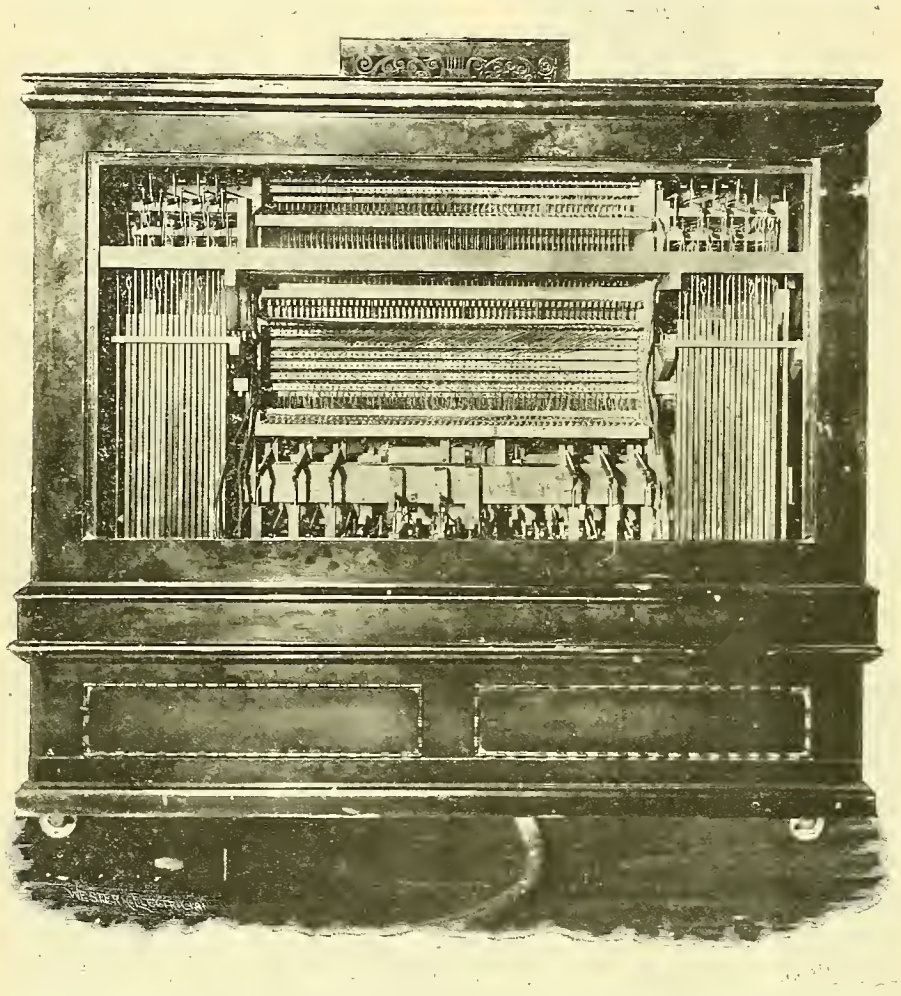

FIG. 4. STEINWAY HALL, CHICAGO, AND ITS ELECTRIC ORGAN.—KEY-DESK MECHANISM.

# COMMUNICATION.

## Complicated Telephone Litigation.

*To the Editor of the* WESTERN ELECTRICIAN:

One of the queer things in the telephone litigation is brought to mind by the odd litigation now in process in the Seventh Judicial District, U. S. Circuit Court.

A suit by the Thomson-Houston Electric company against the Western Electric company appears to be prosecuted by the representative law offices of the Bell company at Boston and defended by the representative law offices of the Bell company in Chicago. Another singular fact in connection with this case is also that the counsel for the government in the suits against the Bell company is prominently represented with the Bell company's Boston law offices in these same suits.

The writer's judgment is that an effort is being made, not so much to defend a Thomson-Houston patent, or sustain it, as between the parties to this legal controversy, as there is a disposition to obtain a rule by this Circuit Court upon questions which will later be more greatly involved in other cases.

A prophecy may not be out of place. In no other way could a certain adjudication by the Circuit Court of Appeals be had upon questions at issue in these first cases, unless, to begin with, an unfavorable decision occurred in the lower court, as in the Boston case A reversal by the Circuit Court of Appeals in this judicial district involving grave questions may be looked for and would not be surprising.

THE TELEPHONE PROTECTIVE ASSOCIATION OF AMERICA.
J. E. KEELYN, President.

*Chicago, June 11, 1895.*

## Electric Gold Mining in New Zealand.

An interesting account was given recently by Robert Hay of the applicatioo of water power in producing electricity for use in gold dredging in Shotover river, New Zealand. The water is obtained at a creek 1½ miles distant from the dredging ground, and brought by a race-cut in the side of the hill, or, in places where the ground is not suitable, in a timber flume to a pressure tank at a level of 524 feet above the pipes at the power house. From this tank to the Pelton wheel the water is carried in rolled steel pipes, constructed in lengths 19 feet six inches bolted together by wrought-iron flanges riveted to the pipes. The prime mover of the generating plant is a four-foot Pelton reaction waterwheel, upon the buckets of which the water, from a nozzle 1½ inches in diameter, impinges at a pressure of 228 pounds per square inch. This wheel drives two series-wound dynamos working at a normal speed of 700 revolutions per minute, each developing a current of 40 amperes, at an electromotive force of 650 volts, or nearly 70 horse power. The dynamos are coupled in series. The conductors, of a length of two miles, are of bare copper wire, and are supported upon insulators carried by cross-arms upon old 40 pound rails. The current is conducted to two motors in the dredge, one for driving a centrifugal pump and the other for operating the buckets, winches and revolving cylinder. These two machines are duplicates of the dynamos, and are coupled in series, so that when the bucket motor is switched off, the pump motor absorbs the surplus power by increasing the speed of the pump, and causing it to throw more water. The dredge is constructed for the most part of steel, and is capable, when operating at a depth of 20 feet, of an output of 90 cubic yards per hour. The dredgings are delivered through a revolving screen, for separating the stones and coarser material, upon baize tables set at an inclination of one in 12. Two ten-ampere arc lamps light the dredge at night, and are joined in multiple series with the motors, with suitable arrangements for their control. The cost of the installation and the weekly working expenses are $35,000 and $175 respectively.

## Electricity in Germany.

According to the *Elektrotechnische Zeitschrift*, the following tables show the electrical energy utilized and projected in Germany:

| SYSTEMS. | No. of Stations. | Horse Power of Machines. | Horse Power of Battery. | Total H. P. |
|---|---|---|---|---|
| Continuous current with accumulators | 80 | 14,388 | 4,459 | 18 847 |
| Continuous current without accumulators | 40 | 11,621 | ..... | 11,621 |
| Alternate current | 15 | 4,208 | ..... | 4,208 |
| Polyphase current | 8 | 2,858 | ..... | 2,858 |
| *Mixed Systems.* | | | | |
| Polyphase and continuous with accumulators. | 2 | 646 | 32 | 678 |
| Primary alternate, constant current with accumulators secondary | 1 | 99 | 68 | 197 |
| Continuous and alternating | 2 | 76 | . | 76 |
| | 148 | 33,896 | 4,589 | 8,485 |

These 148 stations are divided into 135 localities.

| MOTIVE FORCE. | No of Stations | Total H. P. of Machines |
|---|---|---|
| Steam | 80 | 27,290 |
| Hydraulic | 44 | 3,938 |
| Gas | 5 | 265 |
| Compressed air | 1 | 14 |
| Electric motors | 3 | 126 |
| *Mixed Systems.* | | |
| Steam and hydraulic | 11 | 893 |
| Gas and hydraulic | 1 | 30 |
| Steam and gas | 3 | 1,341 |
| | 148 | 33,897 |

| | |
|---|---|
| No. of incandescent lamps of 50 watts | 493,081 |
| No. of arc lamps of 10 amperes | 12,357 |
| Horse power in motors | 5,615 |
| No. of prospective stations decided upon | 34 |

## Institute Meeting at Niagara Falls.

Next week's general meeting of the American Institute of Electrical Engineers, at Niagara Falls, beginning on Tuesday, promises to be a decided success. Much interest is manifested and quite a large Chicago delegation will be in attendance. Since the preliminary programmes were distributed to the members, the convention rate of one and one-third fare on the certificate plan has been granted by the Central Traffic association and the Boston Passenger committee. This, together with the concession of the Trunk Line association, covers practically all the territory east of the Mississippi river and north of Richmond and St. Louis, conditional upon an attendance of 100 who have traveled by rail to the meeting. Those who expect to attend the meeting, whether members or not, are requested to send their names to R. W. Pope, secretary, 26 Cortlandt street, New York. The papers to be read were enumerated in the WESTERN ELECTRICIAN of last week.

## All Eyes on Chicago.

[From the New York *Sun.*]

It is not necessary that anybody should urge the managers of the Manhattan Elevated Railway company to adopt electricity as a motor in the place of steam. As soon as it is ascertained that electricity is more useful and otherwise more advantageous for the service than steam, and is less expensive as a motor for the trains, they will not need any further argument. They will be unable even to consult their own wishes in the case, if they have any wishes. Economic laws clear the way for their own application and provide for their own enforcement, irrespective of any man's will or any opposing interest.

We suppose that the result of the use of the electric motor upon the Metropolitan West Side Elevated railway in Chicago may influence the action of the managers of all the elevated lines in the country. The Chicago experiment is the first of the kind in the United States, and it has followed hard upon that of the Overhead railway in England. The reports from Chicago about the immediate success of the new experiment are in luxuriant language, and we trust that our Chicago contemporaries are as accurate as they are verbose in their descriptions of it. It is possible that they do not take sufficient account of questions in engineering and in finance which require time for their determination, and which are of interest to the New York and Boston capitalists who have furnished the means for the Chicago company. We shall know more before long.

If things continue to go favorably in Chicago, and economies are effected by the substitution of the electric for the steam motor, the example set by Chicago will surely be followed upon all the elevated railways in the United States just as soon as the necessary arrangements can be made, and wholly regardless of the first expense account.

The plant of the Baxter Electric Motor company of Baltimore has been sold to B. F. Deford, Jesse Hillis and Michael Jenkins, representing the bondholders of the corporation. The price paid was $25,000. The property includes a square of ground bounded by Chester street, Chase street, Collington avenue and Biddle street, and is improved by a two-story brick factory 320 feet long and 60 feet wide, and also a brick power house, brick drying house, a frame stable and all the patents of the corporation, together with the machinery, tools and finished product.

## Col. Payne's Income.

Ever since the United States Court placed the Milwaukee Street Railway company in the hands of receivers, there has been considerable speculation as to the salaries that the two receivers, George R. Sheldon of New York and Henry C. Payne of Milwaukee would receive. It was at first reported that they would serve as receivers without pay, on account of their own interests in the property and their desire to place it upon a business-like basis, but Mr. Payne denied

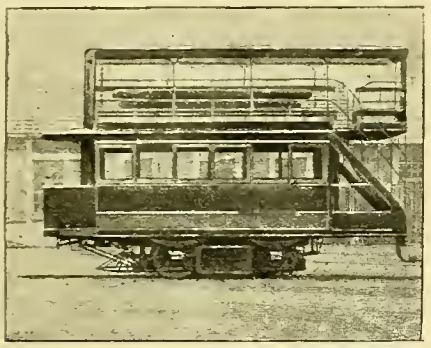

FIG. 2. ACCUMULATORS ON ELECTRIC RAILROADS.—BATTERIES IN PLACE.

the story in a most convincing manner. "Does anybody," he asked, "take me for a fool? Do you suppose that I am going to worry myself to death about this matter and all for nothing? It is the most ridiculous thing that I ever heard of." The most general estimate of the salaries that the two receivers will be paid is $10,000 each. The property in their charge is probably the largest and most valuable street railway property that ever went into bankruptcy and there will be plenty of work for the receivers in winding up its affairs and in conducting its current business. Mr. Payne, who, by the way, is president of the Wisconsin Telephone company, receives a salary of $18,000 a year as receiver of the Northern Pacific Railroad company. He is one of the busiest men in the United States, for in addition he is a director of one of Milwaukee's leading banks and he has many other interests.

## Mineral and Metal Production.

The table of mineral production of the United States for 1893 and 1894, compiled for *Mineral Industry*, which is a statistical supplement to the *Engineering and Mining Journal*, has been completed, and, as usual, it is full of valuable information and timely suggestions. The total value of the mineral products of the country, as shown in this table, was $615,887,108 in 1893, and $553,352,996 in 1894; showing a decrease in values last year of $62,534,112, or 10 per cent. The year 1894 will long be remembered as one of low prices and in almost every industry values were brought down to a point lower than had ever been before known. It was a repetition of the experience of former panic periods, only intensified by the general distrust provoked by the condition of the currency. It may be an unavoidable result of the concentration of capital and the continual improvement in processes which characterize the present age, that production increases in a greater ratio than consumption, and that at greater or less intervals there is a period when a halt must be called until the demand can again increase to the level of the supply; and 1894, being

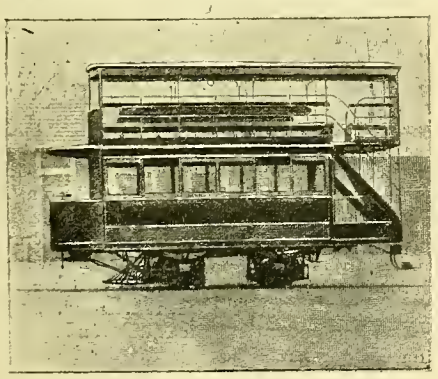

FIG. 3. ACCUMULATORS ON ELECTRIC RAILROADS.—BATTERIES REMOVED.

one of those periods, the producers suffered accordingly. In some important metals there was at actual increase, amounting in the case of copper to 26,250,000 pounds. In this metal the decline in home consumption was offset by a large increase in the exports. The table shows a moderate decrease in production, a much larger proportional decrease in the value or prices, but in both cases a decrease less than the general expectation of its amount. It shows also that in a year of extremely unfavorable conditions the mineral production of the United States by its extent and variety still gives the country the foremost place among the nations of the world—a place which is, above all, surprising, when the comparatively brief period in which the industry has been built up is considered.

## Accumulators on Electric Railroads.

There are arguments for and against the use of accumulators for electrical traction. The batteries are heavy, but they are readily handled and very convenient. They are expensive in the first instance, but not more so than the copper for an overhead line. There is no electrolysis, and no objection is raised by fire marshals and city electricians, and peace is preferable to war, even with electric railway promoters.

There is well grounded belief on the part of city authorities, based on experiment, that sooner or later even the best and most recent arrangements for the return circuit will prove unsatisfactory, although the system of to-day are far better than those in use a short time ago. There is still more or less tramp current escaping along the lines, or in the vicinity of these roads, and there always will be, while the laws governing branch circuits exists.

There are ways out of the difficulties belonging to and inseparable from the overhead system, one of which is the use of storage batteries placed on the car. It has the advantage over the present system of overhead wiring of being entirely safe from life or fire hazard, for each car is its own power house. It is ready to move at any time when called upon, and the changing of exhausted for fresh batteries where proper systems are utilized is of but little more consequence than the changing of locomotives on a steam road, and these changes may be made, for the most part, when the car is off duty.

A line of road has been recently opened at Paris from the Madeleine to St. Denis, a distance of, say, 5¾ miles, about one-half of which is within the city limits, though not

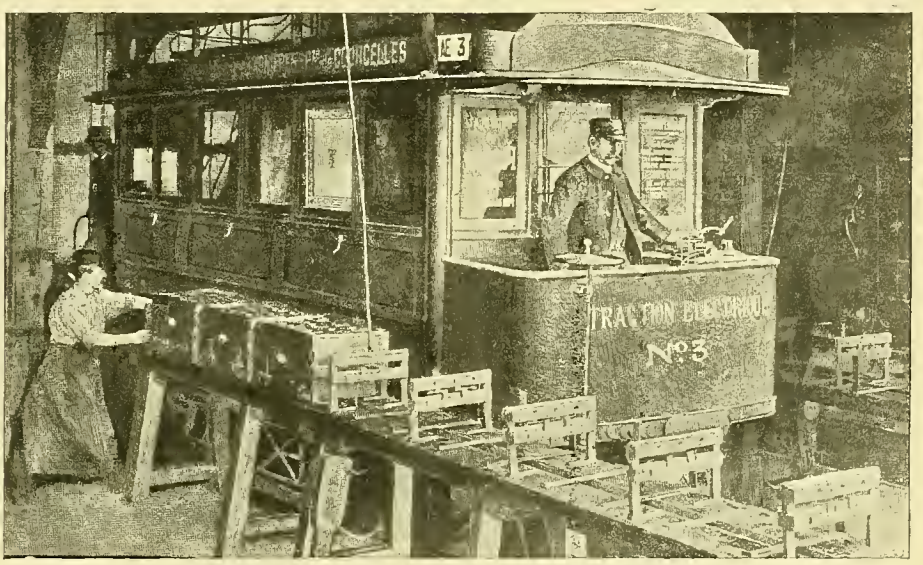

FIG. 1. ACCUMULATORS ON ELECTRIC RAILROADS.—CHANGING THE BATTERIES.

in the fashionable districts. The cars of the lines which radiate from the passenger station at St. Denis are of the form known in Europe as covered imperials—covered double-deckers—of 50 seats, 24 on deck, 20 inside, and six on the platform. The cars are lighted by four incandescent lamps fed by the accumulator battery. The curves of the road in some instances have a radius less than 20 meters, and it comprises grades as steep as 38 millimeters per meter. The trucks are connected by a spring union, which permits of the necessary lateral motion, and also the unequal movement in passing curves and restores them to parallelism on a straight line. Each driving axle is operated by a machine through a single gear connection. The motors are bipolar, with Gramme rings. They are excited in derivation. The brushes are of carbon. Each machine when driven at a speed of 600 revolutions per minute is equal to about 12 horse power.

The charging current is furnished by three Desroziers dynamos, each being run by a horizontal condensing Corliss engine of 125 horse power. Two of these have a speed of 75 and the third 160 revolutions per minute. The last is coupled direct, while the first two are independently connected. At a speed of 600 revolutions these dynamos generate 250 amperes of current at 260 to 280 volts. These are grouped in parallel, as are the batteries during the charging. The duration of the charge is five hours for a battery having exhausted itself by furnishing 230 ampere hours or 52 horse power hours. The efficiency of the batteries is shown to be 70 per cent. Two of the charging machines are run 23 hours per day, while the third is only active six hours daily.

The battery room comprises 24 stalls for recharging. Each of these is connected with a distribution board, and is charged by its individual circuit, in which are found an ammeter, a current direction indicator, a double-pole switch and cut-out fuse.

The batteries have the following dimensions: Height, 0.2 meter; width, 0.2 meter; thickness of positives, 0.007 meter; thickness of negatives, 0.005 meter.

When a car is run in, a traveling table is set in motion, which brings opposite to the car a series of little so-called "wagonets," Fig. 1, which, all save one, contain charged batteries. The first empty cell is drawn out into the empty wagonet, and its place on the car is taken by the first full cell. This process of exchange is continued until the car is loaded, and the empty cells are then shoved along to the charging department to be recharged. This traveling table may be lowered or raised to bring it to the exact level of the car. A few of the cars have been arranged with special reference to a still more rapid change. The use of lighter positive plates having more exposure permits of the batteries being handled in a single drawer, and all at once shoved between the axles of the car, as shown in Figs. 2 and 3. A switch permits of reversing the car, or of throwing one of the motors out of service for any cause and leaving the other to run the car alone. This switch, while it accomplishes much, is so simple that the former drivers are abundantly capable of manipulating it readily. Each lamp in the car is on an independent circuit and has its own switch. The service per day comprises 52 round trips between the Madeleine and St. Denis, and is run by seven cars, making 48 to 62 per cent. more kilometers than was formerly made by the horse cars.

A noteworthy fact in this connection is that before the introduction of electrical traction on one of the lines in Paris there had been a yearly diminution of from 150,000 to 200,000 passengers, while after the completion of the electrica equipment not only was this leak stopped but there was a sudden increase amounting to 1,000,000 passengers the first year.

A system of thorough inspection keeps the batteries in excellent condition.

The cost per car-kilometer of the electric system is thus divided: First, maintenance and repairs of accumulators, 10 centimes; second, station power, 13 centimes; third, repairs of trucks and motors, 3 centimes; fourth, motor man, 8 centimes; total, 34 centimes.

Thirty-four one-hundredths of a franc is a reduction of 30 per cent. on the cost of the former vehicles, and is less than any other system of mechanical traction known.

The advantages claimed for the accumulator system are: First, great elasticity of the service—any number of extra cars can be placed on the line at any time; second, absolute independence of each of the cars; third, non-liability to evil results from a breakdown at the power house; fourth, economy in the installation of the power house; fifth, economical production of current, only so much being generated as will be needed; sixth, small expense for repairs on the generators, which move regularly and are not subject to sudden strains; seventh, maximum utilization of the rolling stock—the empty seats are fewer where single cars are run. The illustrations are from *L'Energie Electrique*.

The Chicago City Railway company is endeavoring to secure the consents of property owners for a downtown overhead trolley line through South Clark street to Washington street. The idea is to parallel the State street cable line on the west with a rapid transit line for the benefit of Englewood and vicinity by way of Wentworth avenue,

Western Electrician.

EVERY SATURDAY.

PUBLICATION OFFICES:
6 Lakeside Building, - - CHICAGO.
TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

ELECTRIC light and gas men of Texas have found that they can dwell in harmony, and they have accordingly formed a state organization in which both interests are well represented. There is no reason why this plan should not be followed in other states with good results. There should be no conflict of interests between the two industries, for there are many ways in which they can assist each other. This is especially true where gas engines can be used for electric lighting plants. There are other instances, too, where the interests of the gas and electric companies are identical.

ONE of the measures sent to the governor for approval by the Illinois Legislature last week was the bill amending the libel law, in which every publisher is to some extent interested. The new law provides that no person can recover exemplary or punitive damages from a paper which has injured him if, as soon as informed of the incorrectness of its statements, it prints a proper retraction, nor can punitive damages be recovered unless the offended person before bringing suit notifies the publisher of his error and the latter fails to print a correction. The right to recover damages where an actual injury has been suffered is not taken away. The bill was supported by the newspapers of the state without exception, as it was considered a vast improvement over the old law, which was harsh and oppressive.

IT is sometimes instructive, in considering an improvement, to reverse the order of progression, looking at it, as it were, through the object glass instead of through the eye glass. Someone once invented a clothespin with a spring to hold it on the line. Of course it was patented and became more expensive than those split stick arrangements our grandmothers used. Reversing the conditions, let us suppose that the patent had been the original and the split stick the improvement, which then would have been th better clothespin? What brings this thought to mind is an anecdote of a remark made by Prof. Crookes to Sir David Salomons. "If," said the professor, "in these days of electric lighting, candles had been just now invented, what a wonderful furore there would be over their advantages? A single light at will, simple and portable, with no encumbering machinery, without the inconvenience of requiring the attachment of two wires to light it."

THE "Digest of Electrical Literature" published weekly in the *Electrical World* is conducted in such an evident spirit of detraction and jealousy, so far as contemporary American electrical journals are concerned, that its value as a record of current electrical literature is very greatly impaired. The "Digest" might be fair and broad and useful, but instead it is envious, petty and narrow. In the issue of June 15th, for instance, under the heading "Belfast," in the "Digest," it is stated that "Some of the illustrations of the article published in the *Electrical World*, May 18th, of this gas engine and accumulator station are reprinted in the WESTERN ELECTRICIAN June 1st." Now, the truth is that both articles were copied from the *Electrical Review* of London, with proper credit. The reprinted article for the WESTERN ELECTRICIAN was in type in time to be used the same week as the *World* article, but was held over to make room for matter considered more important. It is absurd to say that the WESTERN ELECTRICIAN reprinted the *World's* illustrations, and the reference makes perfect evidence of a petty spite. The *World* can hardly aspire to be generous, but it should strive to be just.

THE Supreme Court of Minnesota, in deciding the case of Capehart against Foster, held that "the electric annunciator in a hotel, attached to the wall and to all the wires of the electric call or electric bell system of the hotel is part of the realty," and not, therefore, liable to attachment or other levy, against the tenant who may have purchased it on credit.

By parity of reasoning, other apparatus, similarly connected, would also be a part of the realty, such as a dynamo, etc., being connected with the electric light wiring of the house. So also would electric fixtures, for the same reason; although the court held that gas fixtures, consisting of chandeliers and burners, screwed to the ends of the gaspipes projecting from the walls and ceilings of the building, were not a part of the realty.

While the distinction drawn seems to be an unjust discrimination, it will be well for all electric contractors, in view of this decision, to see that the owner of the realty either joined in the contract for placing such apparatus upon his property or executed a release by which they could be removed in case of non-payment. Special attention is drawn to the decision quoted because the same principles are involved, it is understood, in a number of suits yet pending in this state, growing out of contracts for apparatus put into some of the numerous World's Fair hotels.

IN the penitentiary at Kingston, Ont., there is confined an individual who appears to have successfully deluded his keepers and fellow-convicts into the belief that he is a person of much consequence in the electrical fraternity. Our unsuspecting contemporary, the *Canadian Engineer*, shares in this belief, for it announces that this person, who is heralded to fame as J. Hurd, is "one of the best electricians in America," having "superintended the working of the electrical machinery at the World's Fair in Chicago." The WESTERN ELECTRICIAN is familiar with the electrical features of the World's Fair, but it never heard of "J. Hurd," nor can it find anyone who has had the honor of the gentleman's acquaintance. It would not be difficult to trace the men who occupied responsible positions in the department of electrical operation and maintenance at the exposition, and we do not doubt that every man is at present so conducting himself as to be an ornament and an honor to the community which he favors with his presence. But if any of the "boys" were forced by stress of circumstances to accept the hospitality of a penal institution for a brief period, would he not seek an American prison as the scene of his retirement, rather than immure himself in the slow-going Dominion without prospect of escape? Of course he would. So we are forced to the conclusion, from every point of view, that someone is fooling our excellent Canadian friends.

AT last the opinion of the United States Circuit Court of Appeals in the Berliner case is made public, and, as might have been expected from the decision announced on May 18th, the result is a substantial victory for the Bell interests. The opinion is a remarkable document. It sustains every contention of the Bell company of any importance and places the stamp of judicial approval upon the course of that corporation in its Patent Office proceedings. There are many features of this remarkable document that will require more than passing notice, but at the present time it is only necessary to say that this utterance of the United States Circuit Court of Appeals is a disappointment to the great majority of those who have followed the case. It is a singular fact that so many able lawyers should have pronounced the government's case invincible, that Judge Carpenter should share this opinion, and that in spite of the attention and care bestowed by counsel it remained for Judge Putnam to discover that the case was scarcely worthy of any consideration. Regarding the petition of the government to be permitted to make an amendment alleging violation of duty by the Bell company, the court holds that "to grant this motion would, under the circumstances, violate all the rules requiring diligence from parties complainant." Evidently Judge Putnam considers this application a presumption on the part of the government deserving rebuke.

It is well to remember that this decision merely places the Bell company in the same position it occupied when the Berliner patent was issued. What the value of the patent is remains to be seen.

AN instructive paper, full of important and timely suggestions, is presented in another column on "Danger in Flexible Cord." Mr. Haskins sounds a note of warning against the employment of incompetent and irresponsible men to put in fan motors and other small devices, which may become instruments of destruction if improperly installed. His experience leads him to believe that a large proportion of electrical fires are due first to carelessness on the part of those who through ignorance play the role of experts and attempt work beyond their capacity; second, to willful transgressions of known electrical laws, such as substituting copper wire for fuse metal where the cut-out strip has melted from any cause; and third, to overloading circuits which are already as full as is safe. There are, as Mr. Haskins remarks, a good many things about electricity that the public does not know, but which a little investigation would bring out. For instance, it does not seem to be generally appreciated that an increase of light in a lamp means an increased amount of current consumed; that a wire of a certain capacity is incapable of safely carrying double that amount of current; that when a wire is overloaded the current is partially resolved into heat; and that all wires of a given size are not capable of carrying equal amounts of current without heat. A knowledge of elementary principles should be acquired by the users of electric light and motors. This would lead to an appreciation of the necessity for employing skilled workmen under the direction of experts to do work of this kind.

WHILE the good people of Milwaukee are so earnestly engaged in discussing the municipal lighting project now under consideration in the council, they should not allow an exchange of personalities to distract their attention from the main issue. Our conservative neighbors seem just now on the verge of getting excited. This unusual condition of mind is due to the turn which the discussion over the lighting project has taken. The city engineer, acting under instructions from the council, prepared an estimate of the cost of establishing and operating a plant for lighting the city streets, and the advocates of the plan have been so enthusiastic over the project that they seemed to forget that there might be any possible objection to the scheme. They have been conducting a brass band agitation for a city lighting plant and they are now very much surprised to find that there is opposition to such a measure. A minority report presented by Alderman Ramsey was the stumbling block that they encountered. Opposition from such a quarter does not seem to have been anticipated and at first it is probable that it was not considered seriously. But when the astonished aldermen read the masterly report that their colleague submitted for their consideration they were amazed. It was beyond their comprehension that such an able document could be intended for the proceedings of their body. The arguments against the city engaging in such an enterprise as that proposed were unanswerable. Be it said to the credit of the city fathers of Milwaukee that they wasted no time in vain attempts to make reply, for they realized their utter inability to make a creditably defense of their position. But the petty spite shown in their allusions to the identity of the author of the report does not comport with their character as public-spirited citizens. It was much more creditable for Alderman Ramsey to enlist the aid of a scholar and statesman in the preparation of a report on such an important subject than for these men to sneer at him for doing so. They might emulate his example with profit to themselves and the community. Their plan of indulging in personalities when their stock of arguments was exhausted is an old trick, and it has done much service for men of small mental calibre, but it won't work this time. They must come back to the point under discussion and present arguments supported by facts and figures, in order to convince the public of the wisdom of their course.

## Danger in Flexible Cord.

By C. C. Haskins.

The education of the public in matters of hazard from the standpoint of the property owner or the underwriter is by no means an easy task. Mankind is naturally suspicious, and when the attempt is made to instruct, the thought at once comes to the front, "There is something besides sympathy or kindly disinterestedness in all this flow of honeyed words, and I will not heed advice; I will not be compelled if I can help it, and in any event I like to have my own way best."

We are all just now in the transition stage in the use of electricity both as an illuminant and an element of power. The greater proportion of the community knows nothing of its use for either purpose, by experience, and the majority of those who are using it daily know hardly more of its capabilities for good or harm. It seems so easy; everything about it is so simple. All that is to be done is to take a wire and hitch it on here, and hitch on another somewhere else, fasten the two ends to a lamp, turn the key, and lo! you get just as much light as if the work had been done by a high priced man from a first-class electrical firm. The better way, too, as such persons reason, is not to attempt to do this with wire, but to get a flexible cord; "it will give you just as good a light, it can be manipulated so much easier, and it will show much better than an awkward, ill looking black wire."

Now there are several things about flexible cord that the general public knows nothing of.

Firstly, there are more kinds and qualities of flexible cord —none of them too good—than there are wire manufactories —for each makes several grades—so that when a non-expert, a janitor or a porter, is sent for flexible cord he thinks he does well when he buys the cheapest, and of course he gets the poorest.

Secondly, a flexible cord is made up of tinsel-like strands of copper, and after a short time the constant handling to which it is subjected is very apt to break these thin strands, with one of two results, if not both. The breaking of one of these will reduce the conductivity of the entire length of cord, and this may result mischievously, for in self-installed applications no care is taken, as a rule, to protect the installation by fuses. Again, the break may permit the broken end to stick through the thin covering of the cord and thus invite trouble. That point is just so much naked wire on the line, and is abundantly capable of doing mischief under favorable circumstances.

Thirdly, the fact that the two strands of the flexible cord are from the two sides of the dynamo, and if brought together they will make a direct connection from one pole of the dynamo to the other, is either not known or is ignored by self-created electrical constructors. The only barrier between these two poles, which when brought together are competent for all the mischief which dynamo current is capable of, is the very thin and otherwise miserable insulation which envelops all the cheap varieties of flexible cord.

The season when the electrical fan is to come to the front is upon us. These little one-eighth horse power motors will soon be heard and seen on every hand. With the heated term some of these come forth from their hibernation, and the electrician who formerly mended washing machines or wringers peddles some in new places. With 30 feet or more of cheap cord, he shows the uninitiated that a lamp can be removed and an attachment made, and the fan will run, and can be carried all over the room, while consuming only the same amount of current as the lamp for which it is substituted, "because it fits in the same place. See?" The fan motor may or may not absorb more current, may or may not be safe, may or may not eventually create trouble. The wringer electrician doesn't care and the purchaser doesn't know. The former gets his money cheap, and the latter gets a cheap installation.

A large proportion of the fires from electrical current are due and chargeable to: First, carelessness on the part of those who through ignorance play the role of experts and do those things which I have hinted at above; second, willful transgressions of known electrical laws, such as substituting copper wire for fuse metal where the cut-out strip has melted from any cause; third, overloading circuits which are already as full as is safe. This is often done by exchanging lamps of a lower for a higher candle power. The general public does not know that an increase of light in a lamp means an increased amount of current consumed, that a wire of a certain capacity is incapable of safely carrying double that amount of current, that when a wire is overloaded the current is partially resolved into heat, that all wires of a given size are not capable of carrying equal amounts of current without heat—iron, for instance, requiring over five times as much cross-section as copper. And there are a good many more things about electricity pertaining to safety to person and property that the public has yet to learn.

Anyone can thread a needle and sew on a button, and if a finger gets pricked no one but the owner of the finger suffers, yet all that doesn't make such an one a tailor. If a tailor undertakes the installation of a motor or an additional lamp, it is not alone his finger that is in danger, for death or a conflagration may result from his ignorance, while he may escape injury.

The use of cord in show windows has proven a very fruitful source of loss to the underwriters, and is not now permitted in any similar locality. Motors in windows, too, have been ruled out in all the larger cities. It is sometimes very difficult to convince a man against his will, but when he is shown by argument and facts that assent is money in his pocket, conviction is comparatively easy and sudden; and there is no argument like that which experience uses. A burned child dreads the fire.

## Siemens & Halske Company Purchases the Grant Locomotive Works.

The Siemens & Halske Electric company of America has purchased the Grant Locomotive Works. It will be recalled that the Siemens & Halske company made a lease of the plant less than a year ago, and some time ago negotiations were begun with a view to its purchase prior to the expiration of the lease, that the extensive business already established might be much enlarged and continue on a greater scope of magnitude than had been contemplated. In order to purchase the property it was necessary for the Siemens & Halske company to increase its capital, and this, with other details of a complicated nature, required time as well as skillful negotiation. The capital stock has been increased from $1,000,000 to $2,000,000, of which $700,000 is preferred and $1,300,000 is in common stock. It is interesting to note that the new issue was oversubscribed by $500,000. In payment for the property the Grant Locomotive Works receive $500,000 in the common stock of the company and $200,000 in the preferred. There is at the present time a mortgage of $217,000 against the property, which, according to the agreement entered into, is to be paid off, the property going to the purchasing corporation clear and free of all indebtedness. The Siemens & Halske company of America is composed of the interests of the parent company of Berlin, with branches at St. Petersburg, Vienna and London, and President O. W. Meysenburg and Secretary A. W. Wright of the American corporation, who are responsible for the high standing and the magnitude of the operations of the company on this side of the water. The Grant Locomotive Works are in the hands of W. K. Ackerman and James H. Wilson, receivers, the title to the land being in President David B. Lyman of the Chicago Title & Trust company, who has carefully conducted the present negotiations, and President E. G. Keith of the Metropolitan National Bank, as trustees.

## Springfield's Electric Light Plant.

[From the *Chicago Record.*]

Nearly all American cities find themselves face to face and forced to grapple with lighting and other difficult municipal problems. Because of simpler conditions many of the smaller cities are foremost in successful attempts at solving these problems. Many have done so by establishing municipal lighting plants. Among these is Springfield, the capital of this state, whose plant has been put in recently.

For several years the city has been supplied with light by a private company, but its charges were considered too high, being $138 per arc lamp a year. The effort to start a municipal plant was blocked at first by the fact that the city had reached its limit of bonded indebtedness. At length, however, sixty public-spirited citizens came to the assistance of the council. They loaned the city their credit to enable it to enter into an agreement whereby it eventually would become the possessor of a plant without the expenditure of any more money than its light had cost before.

On the strength of the credit loaned by the sixty gentlemen referred to, the city borrowed money and put up an electric light plant. Two skilled electricians were given a lease, who agreed to furnish light to the city for $60 per arc lamp. The council pays for the lamps used at the rate of $113 a year, instead of $138, the price paid to the private company. The difference between $60 and $113 is turned into a sinking fund, which in less than five years will completely pay for the plant, which will then be the absolute property of the city. After that the city can supply itself with light at cost, which must be less than $60 an arc lamp, or private individuals could not furnish it at that price. By adopting the plan of municipal ownership, therefore, the city of Springfield, for the next five years, will get its light at $113 per arc lamp, as against $138 under private management. After that the city will own its plant and can supply itself with light, it is fair to presume, at $60 a lamp or less.

One difficulty in connection with the establishment of municipal lighting plants in Illinois is that the general charter act does not authorize cities to sell light to private consumers. In many of the smaller cities, where the lighting paid for by the council is not sufficient to warrant the establishment of a municipal plant, one could be started to advantage if the city could do commercial lighting. This at the same time would be a great accommodation to the people. A bill authorizing cities to sell light to their citizens was introduced in the Legislature early this session, but, like other bills displeasing to existing corporations, especially in Chicago, it was effectually buried.

It will not be very long, however, before the people will force the Legislature to pass a bill of this kind.

## Assumption of Risks by Electric Light Linemen.

In deciding the case of Smart against the Louisiana Electric Light company (17 Southern Reporter, 346), the Supreme Court of Louisiana said:

There are general rules applying especially to the relation of employer and employe. Under these rules, it is presumed that every person of average intelligence has knowledge of the destructive forces of nature. If the work he performs exposes him to danger from these forces, he assumes the risk of the injury. Every man of experience, in handling wires when heavily charged with electricity, will be taken to understand that he must use great prudence. The authorities generally announce that if the employe has full and equal knowledge with the employer that the appliances are defective, and each is equally indifferent to the danger, they will stand on a footing of equality as to damages. In the first place, however, it is the employer's duty to be careful that his workman be not induced to work under the notion that the appliances are safe when he knows or has reasonable ground to believe that they are dangerous. On the other hand, it is the duty of every workman to execute the work with required care, and not expose himself to injury. These being the governing principles of the law of personal injuries, we take up, first, the charge that the wires on which the deceased was working should (in electrical parlance) have been made "dead."

The deceased and another lineman had been directed to take down two alternating live wires from their position on one arm of a pole, and place them below other wires on another arm. The service is not necessarily dangerous. The evidence explains that for the purpose of lowering a pair of live wires on a pole, the lineman handles one wire at a time, and that he should not handle more than one. These two wires were near each other; not more than six inches apart. It is in proof that there is no danger whatever in handling a single wire, one side of a circuit, while upon a wooden pole insulated from the ground, and a careful lineman will never handle more than one wire at a time. This is generally understood by all linemen. But there is great danger in touching both live wires, and completing a circuit. While at work, lowering the lines from one arm of the pole to another just below, the deceased was not observed at the instant of the accident by those present. A moment after he had received the fatal shock, his body was taken down by his fellow workmen. When he received the shock he had on rubber gloves. He was a competent lineman. A few moments prior to the shock, the foreman of the party working at the pole directed the two men engaged in lowering the wires to wear gloves. At the same time he sent up the gloves to the top of the pole where the men were at work. The deceased complied with the direction of the foreman. The other did not, trusting to his naked hand, but received no injury, although he was handling the wire corresponding to the one which was being handled by deceased. The evidence shows that the linemen were to take care of their gloves and keep them in good condition, and carry them in their belts for use when needed. It was also shown that it was left with them to determine when to exchange an old for a new pair.

The officer in charge of the operation of the plant testified that any lineman could order the opening of a circuit at the plant in case of necessity. The record does not disclose that any such necessity was suggested by the lineman. The principle announced on this point is that the employe who has the opportunity to avoid danger will have no recourse for the injury. We are led to infer from the testimony that it is not usual to open the circuit and deaden the wires while linemen are lowering them, as in this case.

As to any defect in the insulation of the wire, and that it was not in proper condition, it is a matter that would have great force if brought by one not in the employ of the company; but the testimony here informs us that where a lineman goes on a pole, and finds a defectively insulated wire, it is his duty to remedy the defect. The fact that such is the duty is not seriously questioned. The risk is one of those assumed by the employe.

It is evident that this experienced lineman knew the danger, and that, under ordinary circumstances, he would not have touched the two wires at the same time. We feel justified in the inference that the gloves were unsafe. They were furnished by the company without charge, had been in use a number of years, and were such as are generally used at the present time. Under the rules the workmen were required to examine daily the appliances furnished them, and in case of defect return them to the storekeeper. It is insisted that these rules were not generally known to the linemen. It is shown that these were defective, and should have been returned. It is insisted that he acted with ordinary care in putting on the gloves given him by the foreman. But it is not shown that the latter represented the employer; he had no power to employ or discharge the men under him, and was a fellow workman. The gloves were not in his charge; he only picked them out of the wagon and sent them up; the other lineman did not put those sent him on. The lineman injured assumed all the risks referred to, and the company is not liable for resulting damage.

## New Use for Old Insulators.

On the wall of the office of the general administration of postoffices, telephones and telegraphs at Brussells, there recently appeared a poster which announced a coming auction sale of second-hand insulators. The last paragraph reads as follows:

These articles will be sold in one or more lots to suit purchasers, and may be utilized for borders to parks and gardens.

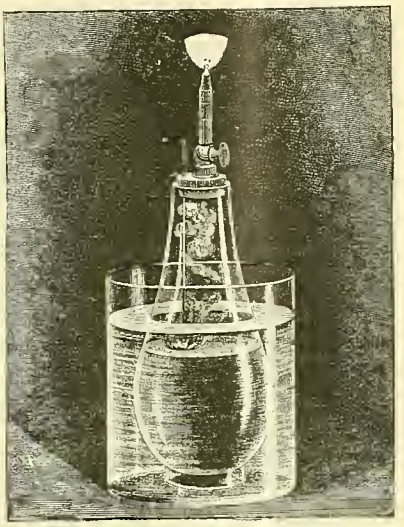
## Gas Engines for English Electric Lighting Plant.

In the accompanying illustration is shown the dynamo and engine room of the new electric lighting plant driven by gas engines which has been installed by the Midland Railway company at Leicester and which is said to be the largest of the kind in England. There are four large gas engines and two smaller ones specially fitted for driving dynamos with the necessary steadiness. Each of the four large engines is of 25 nominal horse power, capable of giving off 40 brake horse power as a safe working load with Dowson gas; and instead of the two overhung flywheels usually employed, one heavy flywheel, seven feet six inches in diameter by 19 inches wide, and weighing 4,500 pounds is fitted on each engine, with a massive out-end bearing and pedestal for supporting the end of the shaft. The engines run at 200 revolutions per minute and with the means adopted very great steadiness is obtained. The face of the flywheels is slightly rounded, and the dynamos are driven directly from it. The crankshafts are cut out of solid steel forgings and are machined and polished all over. The cylinders are fitted with loose liners, made like the pistons of specially hard metal, so that when they are worn beyond the stage at which reboring is possible, they can be renewed at the smallest possible cost. Owing to the high speed at which the engines run, special attention has been paid to the bearings and to all the parts of the engines, with a view to easy maintenance and facility of renewals at the least cost. Automatic lubricators have been fitted to all the vital parts. A novel feature in connection with these engines is the new igniting arrangement. Instead of the metal tubes, which are short lived, a short porcelain tube is used. It is about three inches long and if not destroyed by careless handling, it is imperishable. It is quickly heated, thus reducing the time required for starting after the burner is lighted to about a minute and a half, besides being low in the first cost. The engines are started by Crossley's self-starting apparatus, which enables an engine to be set in motion with nearly half load on. Thus fast and loose pulleys on the dynamo, or on other machinery the engine has to drive, are rendered in many cases unnecessary.

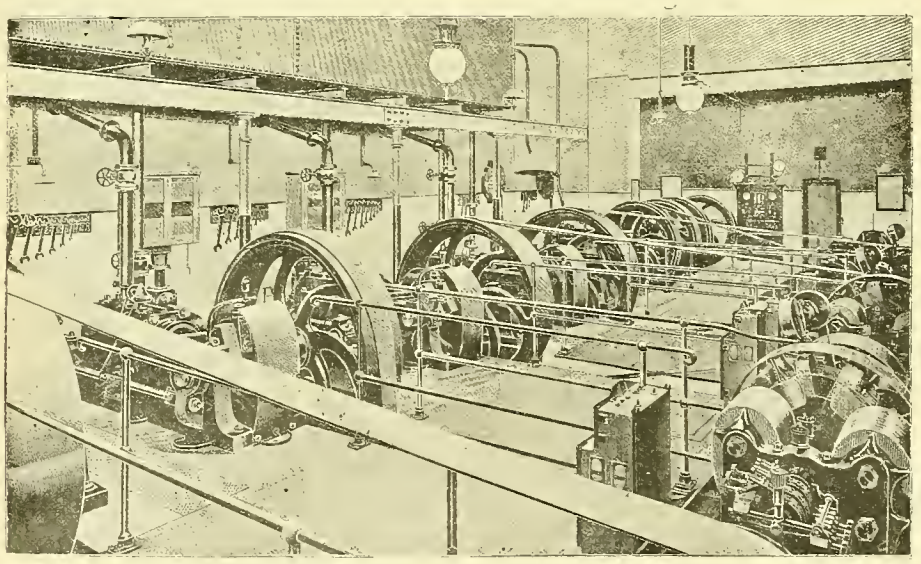
The two smaller engines at Leicester are each of 14 nominal horse power, capable of working up to 25 brake horse power with coal gas, and are each fitted with two overhung flywheels running at 200 revolutions per minute. Each engine is fitted with governors used for electric lighting work and is generally on the lines of the larger engines. Although the heavy flywheels militate against the efficiency of the engines, it costs less to store up the necessary energy to insure steady running by increasing the flywheel power of the engine than it would do to achieve the same result on the dynamo.

For the jacket water for these engines one large tank is fixed on columns and girders and contains sufficient water for cooling the cylinders of the engines even if all were working at once. Under ordinary circumstances the engines are worked with Dowson gas, but arrangements are made whereby, in the event of anything being out of order with the gas plant, the engines can be immediately turned on to coal gas from the town's mains. Three of the four larger engines are connected to Brush series arc lighting machines capable of driving 50 2,000 candle power lamps each; the fourth large engine driving an incandescent machine of 300 amperes. Each of the smaller engines drives a small machine for incandescent lighting, giving an output of 125 amperes at 115 volts. The arc lighting is required for the goods yards and sheds belonging to the Midland and London and Northwestern Railway companies, and for the platforms, etc., of the new passenger station. The incandescent lighting is employed for the refreshment rooms, dining rooms and offices.

The gas plant is placed in a separate building adjoining the engine house. There are two gas generators and each has a gas cooler, hydraulic box, coke scrubber and sawdust scrubber. Space has been left for a third set, which has not yet been supplied. The gasholder is 16 feet diameter by 10 feet deep. There are two small vertical boilers, but only one is used, the other being in reserve. The generators are fired with anthracite coal and the boiler with common boiler slack. The engines were manufactured by Crossley Brothers of Manchester. The cut is reproduced from the London *Engineer*.



SLOANE'S NOVEL ACETYLENE GAS BURNER.



GAS ENGINES FOR ENGLISH ELECTRIC LIGHTING PLANT.

## New Telephone Enterprises.

The Rogue River Telephone company contemplates building a line into Medford, Wash. It has begun work on an extension to Central Point.

The Badger State Telephone company of Hartford, Wis., has been incorporated. It will build a line northward from Iron Ridge.

The Home Telephone company has begun work on a line connecting Montgomery, Lexington and Le Sueur Center, Minn.

The Rocky Mountain Bell Telephone company will soon extend its line from Butte to Whitehall, Mont., the new location of the Parrott smelters. The line between Helena and Great Falls will be completed July 1st. It is 105 miles long and will be double circuited.

Maurice Auerbach of St. Paul, representing the Standard Telephone company, says that they will soon begin operations there.

The Marquette County Telephone company of Ishpeming, Mich., proposes to rush work on its line and will have it in operation in less than three months. This company will also build a line to Palmer, Mich. The cost of it will be borne by Clarke Kirkpatrick, and it will be his personal property.

The Phœnix Construction company of Indianapolis, Ind., will be an applicant for a telephone franchise at Mankato, Minn., C. M. Waterbury, general manager, being there to make the application. This company uses a complete metallic circuit and offers a guarantee that it does not infringe on the Bell patents.

## Sloane's Novel Acetylene Gas Burner.

The ready development of acetylene gas from calcic carbide is shown in the simplest possible manner by dropping a fragment of the carbide, the size of a small pea, in a glass of water. The gas will escape rapidly and if a lighted match be held above the bursting bubbles, a rapid series of miniature blazes will result.

If a steady flame is desired, the simple apparatus illustrated herewith will prove an inexpensive but very complete method of accomplishing that result. It consists of a tumbler sufficiently large to receive a lamp chimney, the upper end of this being closed with a cork, into which a gas burner is fixed with a quite minute opening. A rod descends through the cork also with a pan at its lower end, upon which to place the calcic carbide. This rod should fit very tightly, otherwise the gas will escape through the space around it. When all is ready the rod may be drawn up near the cork, its little pan being thus kept out of the water until the proper moment. The stop cock is then opened and the inner vessel forced down into the glass. The outer pressure will force the water into the lamp chimney until it rises to the surrounding level. If the rod is pushed down so as to immerse the carbide, the gas will escape and force its way out at the burner, where it may be lighted as shown. Care must be exercised that the mixture of gas and atmospheric air is not lighted, for an explosion might follow, and it is for this reason that the opening in the burner should be extremely small—so small that flame cannot pass through it. Whenever the gas is generated faster than it is consumed, the pressure will force the water down until it passes below the mass, when the formation of gas will cease, because the mass is out of the water, this latter being held down by the gas pressure. The illustration is from *La Nature*.

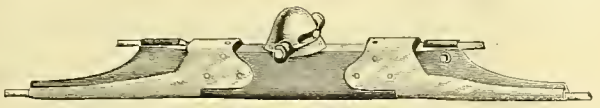
## Wisconsin Railway Enterprise.

Articles incorporating the Milwaukee & Waukesha Railway company have been filed in the office of the secretary of state. The capital stock is $1,000,000, divided into 10,000 shares of $100 each. The incorporators are Max Rosenthal, James Hetley, A. B. Myers, Stutley I. Henderson, Jacob Wellauer, Charles Pittlekow and Joel W. Bingham of Milwaukee and John J. Constantine and Andrew Snyder of Waukesha. The company is simply an enlargement of the Milwaukee & Wauwatosa Railway company, which has operated a dummy line for several years, but now proposes to extend its line to Waukesha and to run electric cars over its entire system. Mr. Bingham is president of the company, and it is stated that more than $300,000 of the capital stock has already been subscribed. The present tracks to North Greenfield will be used and from that point the line will parallel the Chicago & Northwestern Railway company all the way to Waukesha, where cars will stop at or near the Wisconsin Central depot. It is announced that the building of the line will be begun almost immediately and that it is intended to have the line in operation for the state fair; but it is very doubtful whether the work will actually be begun at once and whether it will be completed by the end of the year. The present lines, however, will undoubtedly be equipped with electricity without delay. Two power houses will be built for the new line, one at Milwaukee and the other at Waukesha.

A press dispatch from Tacoma, Wash., announces that the Armours will resist the attempt of the New York Guaranty & Indemnity company to foreclose the $1,350,000 mortgage against the Tacoma Railway & Motor company. The dispatch says: "The Armours became interested in the local street railway company several years ago when it had $750,000 in capital stock. On this Schulz issued $1,500,000 in bonds and disposed of $1,350,000 through the New York Guaranty & Indemnity company. The Armours are innocent stockholders, and not being represented in the issue of bonds, claim the bond issue was excessive and unwarranted. In placing these bonds it is alleged Schulz made use of a dummy syndicate. Another feature of the deal was the purchasing of a suburban railway for $350,000 when it was valued at but $60,000, beside turning over to the seller a bonus of $141,000. All this the Armour stockholders claim was done in collusion and with a view to permitting the General Electric company to wreck the local street railways."

## Compact Ship Lighting Set.

For the last few years efforts have been made to secure greater compactness in electric ship lighting plants, and the latest type which is now being built by the General Electric company is an instance of success in this direction. The combination shown in the illustration consists of a double cylinder vertical engine, 4¼ by four inches, directly coupled to a General Electric multipolar generator. It is known as an eight kilowatt set, the voltage of the dynamo being 110 volts. In the generator, which is of the latest type, all the material of the frame is available for magnetic purposes, so that the magnetic leakage is reduced to a minimum—a point of vit



MEDBERY SECTION INSULATOR.

tal importance on board ship. The frame is of cast soft-steel of very high magnetic permeability, and the armature is iron-clad; the windings are sunk in slots in the outer surface of the armature core, are interchangeable and can be easily replaced. Provision is made to ventilate the armature thoroughly, and the insulation throughout is practically indestructible. The commutator and brushes work perfectly under all conditions of load, and the regulation has been brought to a high degree of excellence. This generating set occupies a minimum of floor space, and this consideration alone will serve to recommend it to ship-builders and owners. It is remarkable for its smooth running and for the capacity obtained from the size and weight of material used.

## Medbery Section Insulator.

The Medbery section insulator illustrated was originally designed for the Chicago City Railway company, and the entire line is equipped with this very simple yet unusually strong and effective device. During the last year several of the other leading traction companies, particularly in the East, have adopted this insulator with good results to their systems.

The methods of insulating the sections of the line, as well as the ease of adjustment, are all in favor of its use, and are at once appreciated by practical men.

The metal parts are of standard high grade material.

The Mason Electric Equipment company, 307 Dearborn street, Chicago, carries a full line in stock and is prepared to make prompt shipments.

# CORRESPONDENCE.

## New York Notes.

NEW YORK, June 15.—At this week's meeting of the Rapid Transit Commission the chief engineer was instructed to prepare detailed plans and specifications, and submit them to the board for consideration not later than the second Tuesday in September. The proposed Whitehall street extension of the down-town tunnel was approved.

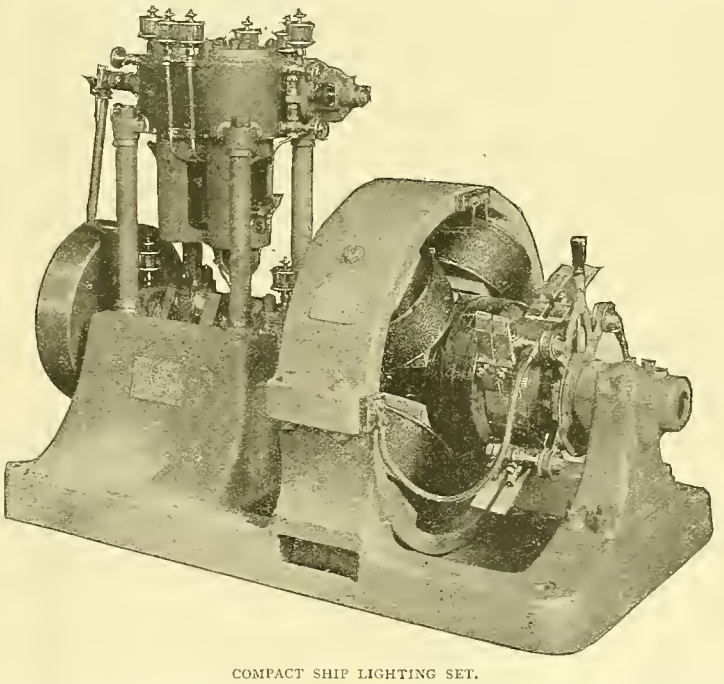
The success of the electrically operated Metropolitan elevated road in Chicago continues to make the traveling public of this city wonder when the Manhattan system will undergo a corresponding improvement. The daily papers have had considerable to say on the subject, and it has even been asserted that the Westinghouse company had secured the contract for the equipment. On this subject, Russell Sage, in talking to a reporter yesterday, said: "I had a note from Col. Hain this morning saying that he had examined the Pittsburg apparatus, and he speaks well of it. He will return to the city to-morrow in order to be here during the ceremonies incident to the opening of the Harlem ship canal on Monday, and next week he will go to Chicago to examine the electrical equipment used on the West Side Elevated in that city. When he shall have completed his inspection of the various methods of applying electricity as a motive power, he will make his report to our committee, and we may ask for estimates from electrical companies. We have not considered yet the probable cost of the changing from steam to electricity, nor can I give you any estimate of the cost per mile. If we should decide to adopt electricity, the change would be made gradually, and a trial would be made first, probably on the Second avenue line. The whole subject is, however, a problem of the future." Col. Hain is the general manager of the Manhattan company. At Pittsburg he made this statement: "We have not contracted with the Westinghouse company for an equipment of the elevated railway. We are here, however, to satisfy ourselves that the Westinghouse company has every facility necessary to do the work. We have not, as intimated, formed any alliance with the Westinghouse Electric company, 'forever shutting out the General Electric company from our patronage.' The statement that the Westingbouse company had accepted the contract at a price which the General Electric would not take is also untrue. We have not even definitely decided on abandoning steam for electric motive power. We have thought electricity might be cheaper and more convenient. On this trip I will make it a point to convince myself of the adaptability of electricity to run trains on our elevated system. If I am satisfied on that point the probabilities are that we will finally give up and substitute electricity as a driving power. We have not as yet asked for bids from either the General Electric or the Westinghouse people. That will be done on our return to New York. Until then I will not be in a position to speak definitely on the matter."

President Lewis of the Brooklyn Heights trolley road, President Partridge of the De Kalb avenue road, and Vice-President Illersley of the Atlantic avenue road had a conference with Mayor Schieren of Brooklyn yesterday in reference to the speed of the trolley cars. They spoke in favor of increasing the present rate of speed, and complained of the reduction in receipts since the six-miles-an-hour ordinance went into effect. Mayor Schieren intimated that some change in the ordinance would meet with his approval.

W. F. O.

## Milwaukee, Wis.

MILWAUKEE, June 15.—The old case of Newton S. Murphey against Benj. M. Weil, which has twice been before the Supreme Court of the state, grew out of a deal in stock in an electric company. On April 7, 1887, Mr. Murphey and Henry E. Jacobs sold to Weil 250 shares of stock in the Jacobs Electric company. They represented $25,000 at par value and were sold to Weil for $12,500. There were also included 250 shares of stock in the Electric Temperature company. Jacobs died and Murphey came into possession of his interests. Then Weil refused to pay for his stock. He alleged that the stock had never been paid up, that the patents which paid for the stock were useless, having been declared invalid by the court and that Murphey induced him to purchase stock by fraudulent representations. The suit was brought to compel the payment of the balance of the purchase price of $12,000. The first trial resulted in favor of the plaintiff. After it came back from the Supreme Court for the last time, it looked as though Murphey might lose his case, but everybody was surprised when the jury gave a verdict for Mr. Weil for the money that he had paid upon his stock and interest thereon. He will recover more than $4,000 under this verdict.



COMPACT SHIP LIGHTING SET.

There are before the Common Council two reports on the question of establishing a municipal electric lighting plant. The majority report of the special committee on electric lighting is strongly in favor of the project, and the report is signed by four of the five members of the committee. At the meeting of the special committee City Engineer Benzenberg explained that in estimating the cost of operating the plant he had purposely figured the expense high, so as to be on the right side. He thought that the plant could be in running order in eight months, possibly in six months if the work were pushed. He suggested that arrangements might be made with the Badger Illuminating company to do as much of the street lighting as necessary until the city plant was in full operation, and that the company could shut off circuits by degrees as the work of constructing the city conduits progressed. This plan, according to the city engineer, had worked very successfully in Detroit. City Comptroller Fiebrantz told the committee that this month there would be a leeway on the bond limit of $1,949,743.04. New bonds to the amount of $720,000 had been authorized, and street improvement bonds amounting to $100,000 were to be issued, making a total of $820,000, and leaving a leeway of $229,743.04. The city engineer said that he thought that $150,000 as a preliminary appropriation for the work would suffice.

The question of the city's purchasing the Badger plant came up at the meeting of the committee, but no recommendation was made, the committee being content to recommend city ownership of an electric light plant in some form. It is thought by some that now that the Milwaukee Street Railway company, which is the owner of the Badger plant, is in the hands of receivers, the Badger plant may be bought at a very reasonable figure, especially in view of the fact that the establishment of a city lighting plant would reduce the business done at the Badger plant more than one-half. The Badger plant cost the Milwaukee Street Railway company $380,000, but that was some years ago, and although it has been greatly improved and enlarged since that time, still electrical machinery and equipment are considerably cheaper now than they were when the Badger plant was started, and besides the depreciation of machinery must be taken into consideration.

The minority report on the municipal lighting question was submitted by Alderman Thomas Ramsey. It advances the opinion that the financial condition of the city of Milwaukee is not such as to permit it to engage in any electric enterprise. It urges that other public improvements are more pressing and it particularly mentions school houses, bridges, public parks, the completion of the intake tunnel and the extension of the water works system. It declares that a municipal lighting plant would necessitate the placing of wires underground in a very large portion of the city, especially in the business district, as the stringing of wires overhead would be dangerous, and it points out that the tearing up of the business streets would result in great inconvenience to the public, the business interests of the city demanding that the pavements be disturbed as little as possible. The minority report also urges that the city should not put in its own plant until it has given the company that is lighting the streets at present an opportunity to bid upon the lighting upon a basis which will enable it to make as low figures as possible to the city. It does not need any argument, the minority report continues, to show that a contract for two or three years cannot be made as cheaply as it can be made for a term of years, which will allow some return upon the capital invested. It is claimed in the report that the figures of the city engineer do not make a sufficient allowance for repairs and maintenance of the plant. For instance, the city engineer estimates that $4.44 a lamp a year will be sufficient, but the report asserts that the amount actually required is in excess of $17 a lamp a year. The report goes on to say that the difference, if any, between

the cost of electric lighting under the contract system and the cost under the municipal system is so slight as not to justify the city in engaging in the enterprise. It points to the experience of other cities, as developed by facts shown in the city clerk's correspondence with them, and adds that "our neighboring city of Chicago is a most striking example" of the fact that municipal lighting is not profitable. The city was at liberty to do its own lighting before any company entered the field, the report says, and could have done so at that time without injuring any private enterprise. But now more than $500,000 is invested in a commercial electric lighting plant and the investments were made at a time when there were practical difficulties to overcome and when the financial returns were uncertain. These investments were in effect encouraged by the city, the report says, and Alderman Ramsey adds that he believes that the city cannot afford to do an injustice to men of enterprise by failing to pay due respect to vested interests. So long as the people now engaged in electric lighting in the city furnish lights to the city at fair and reasonable figures, the city should confine itself to those fields which is its more legitimate duty to develop.

City Engineer Benzenberg denies that his estimate on repairing lamps is too low and asserts that the report submitted by Alderman Ramsey was really drawn up by General Manager Wyman of the Milwaukee Street Railway company, whence, according to the city engineer, all the opposition to the municipal lighting project comes.

## Washington News.

WASHINGTON, D. C., June 15.—Various solutions of the street lighting problem, it is said, have suggested themselves to the commissioners of the District of Columbia. One is the hope, still fondly cherished, that the present electric light company may put in a bid. This, however, is probably a delusive hope, for if that company had intended to bid it would have done so long ago. The other alternative contemplated by the commissioners is a shadowy expectation that a new electric light company may be formed and use the telephone poles for its wires, and the officials are said to hold the opinion that they have the right, if necessary, to erect poles and run overhead wires. This is even less tangible than the expectation that the Electric Light company may do something, for it comes in direct conflict with the statute. The law expressly forbids the stringing of any more overhead wires in the city, and by that law the commissioners are bound as firmly as any corporation.

Arrangements have at last been completed for building the Washington and Baltimore electric road between the two cities. A director of the company says that the Widener-Elkins syndicate of Philadelphia, which is a heavy stockholder in Philadelphia, Baltimore and Washington street railroads, has become interested in the new line and will take a portion of the bond issue. E. D. Smith & Co. of Philadelphia, who have built a number of street railroads for the Widener-Elkins syndicate, will propably do most of the work on the new one.

A case was filed in the United States Supreme Court this week, the decision of which will determine the power of state railroad commissioners in the fixing of telegraph tolls under certain circumstances. The case is that of the railroad commissioner of North Carolina against the Western Union Telegraph company, and it grows out of the complaint of overcharge made by one Robert E. Lovell, who on August 17th last delivered a ten word message to the Western Union operator at the town of Wilson, N. C., for transmission to Edenton in the same state. The operator made a charge of 50 cents for sending the message, notwithstanding the rate fixed for messages inside the state by the commissioners was only 25 cents. Lovell paid the full charge under protest, and brought the matter to the attention of the commissioners, making a complaint. At the hearing the telegraph company set up as a defense that in transmitting the telegram to Edenton it was necessary to send it through Norfolk, Va., and therefore outside the state of North Carolina, and also that as the Western Union had no commercial office at Edenton, it became necessary to transfer the message to another telegraph company at Norfolk, and justified the double charge on the ground that the rate from Wilson to Norfolk was 25 cents, and from Norfolk to Edenton the same price, making necessary a total charge of 50 cents, as collected by the operator. The railroad commission in its ruling held the charge to be excessive and issued an order requiring the company to refund the 25 cents extra and forbidding a continuance of the practice under similar circumstances. The Western Union took the case to the State Supreme Court, where the decision was also adverse to it. It comes to the Federal court on a motion for a writ of error.

Arguments have recently been made before Justice Cole in Criminal Court No. 2 on the petition of Philip A. Deffer and Harry Smith, linemen employed by the Postal Telegraph company. They were arrested several weeks ago for stringing wires on Ninth street, in violation of the ordinance of 1862, and convicted in the police court. They petitioned for a writ of prohibition to prevent their sentence by Judge Kimball. The petitioners claimed that the streets and avenues of the city were owned by the United States and that the telegraph company's employes were responsible to the United States, not the District, for the alleged violation. The law of 1866 was claimed to be sufficient warrant for stringing the wires, because, the attorneys maintained, that the streets of the city were post roads or military roads. They said further that telegraph poles were not obstructions to the streets. Counsel for the opposition answered that Congress had given the District power in the premises and the police court could not, therefore, be prohibited from enforcing its judgment. Justice Cole has taken the matter under advisement.

In the District of Columbia there are 188,567 people old enough to work, that is, from the census standpoint of over ten years of age. Of this large working force there are 203 telegraph and telephone operators and 48 telegraph and telephone linemen and electric light employes, 45 of the telegraph and telephone operators being women.

James Leitch, United States consul at Belize, reports to the State Department that under the new tariff law of British Honduras materials or plants for railways, tramways, electric lighting, telegraphs or telephones are now admitted into that country free of duty.

In the matter of the protest of Dr. Walter Lobach against the decision of the collector of customs at Chicago as to the rate and amount of duties chargeable on philosophical instruments for colleges, the United States general appraisers have rendered the following decision: "The merchandise covered by the protest consists of electric storage batteries, imported for the use of the Armour Institute, an incorporated educational institution. The articles are made of metal, and were assessed for duty at the rate of 45 per cent. ad valorem, as manufacturers of metal not specially enumerated or provided for in the tariff act. They are claimed to be exempt from duty as philosophical or scientific apparatus of the kind described under paragraph 677. It is a matter of common knowledge that electric storage batteries are more especially used for practical purposes in the arts and professions rather than in making observations, experiments and discoveries in the furtherance of science. For a similar reason the board denied free entry to an electric dynamo machine imported for an educational institution. The board finds that the articles in question are not philosophical or scientific apparatus and overrule the protest and affirm the collector's decision."

It is interesting to note the number of arrivals in the United States from other countries of electricians and wire workers. During the year ended June 30, 1894, which is the latest period for which the statistics have been made up, there arrived from Hungary, one wireworker; from Austria, one electrician; from France, one electrician; from Germany, two electricians; from Norway, two electricians; from Sweden, two electricians; from Switzerland, two electricians; from England, 24 electricians; from Scotland, two electricians; from Ireland, four electricians; from Australia, two electricians. This makes a total of 42 electricians; one over 40, the rest under 40 years of age, and one wireworker under 40.

The District Supreme Court has issued an order fixing the amount of capital stock of the Washington & Georgetown & Great Falls Electric Railway company to be $650,000, and confirming the vote of increase to that sum by the majority of stockholders.

The appeal from the decision of Judge Cox in the suit of the Metropolitan club against the United States Electric Light company, to enjoin the latter from cutting off the club light, is to be argued in the Court of Appeals. Judge Cox has granted the injunction asked for, and the appeal is by the company. W.

## Buffalo and Niagara Falls.

BUFFALO, June 14.—The Common Council of Niagara Falls came very near holding another all-night session, the subject under discussion being the franchise asked for the Niagara and Lewiston railroad. This franchise has been before the board for some time and would have been acted upon at the last meeting had not the council adjourned at midnight. Mr. Bissell of Buffalo and Messrs. Ely and Gaskill of Niagara Falls represented the interests of the road, while the property owners were in opposition. It was two o'clock in the morning when a vote was reached and the franchise granted. The franchise is for 50 years and the road must be in operation within six months. In consideration of the franchise, the company agrees to pave Third street from Main to Cedar avenue with first class brick. The Niagara Falls & Lewiston Electric Railroad company formally accepted the franchise on June 10th.

The Builders' Association Exchange is thoroughly in harmony with the project of the Mutual Automatic Telephone company to establish a telephone system in competition with the present system of the Bell company. At a meeting held on June 7th resolutions were passed expressing entire sympathy with the plans of the new concern, and authorizing the secretary of the exchange to make a contract for one of the new instruments. The resolution also urged upon the members that they do all in their power to aid the new company in securing the necessary number of subscribers, so that the exchange may be installed at the earliest possible date. It is said that over 1,500 subscribers have already been secured.

No action will be taken in the matter of a franchise for the Niagara Falls Power company for a week at least. Both of the companies, the Niagara Falls Power company and the Niagara Falls Hydraulic Power & Manufacturing company, are represented by counsel. Attorney Franklin D. Locke represented the interests of the former and Attorney Romer the latter at a recent conference. J. F. Schoelkopf of the latter company was also present. Mr. Locke stated that the company had not received notice of the meeting until Thursday and that it would like a copy of the proposed franchise, that it might study it and be prepared to make an intelligent statement before the committee. He asked that the matter be put over a few days until the official representatives of the company could be present. The city clerk was directed to send a copy of the proposed franchise to each of the companies.

The indications are that there will soon be an electric road connecting Buffalo and Olcott on Lake Ontario, via Williamsville, Swansville and Lockport. Chas. A. Johnson, president of the Lock City Electric Railroad company, and Fred. H. Reed, the contractor, both of New York, and William Treis, a capitalist of Philadelphia, were in Lockport. At the directors' meeting a contract was closed with the Lockport Gas & Electric Light company to furnish power for the street railway in the city of Lockport now about completed.

Trolley affairs continue to be interesting and are engrossing the attention of the public. The extension of the village system at Tonawanda has been postponed for a few days pending the setting aside of the injunction. The Buffalo & Niagara Falls company is now doing considerable work, and Payne avenue is a scene of more than usual activity. The New York Central still has watchmen on the lookout for any undertaking on the part of the Buffalo and Niagara Falls men to lay tracks and to prevent it if possible.

Leonard Henkle, the veteran projector of Rochester, the gentleman who has formulated a scheme for utilizing the power of the Niagara river that eclipses all others in estimates and figures, was in the city and had his plans on exhibition at the office of Superintendent Welch in Prospect Park. In an interview Mr. Henkle said that matters with reference to his project had recently taken a new turn. He had commenced selling stock in the concern at $100 per share, but about a week ago a party of Rochester and Boston capitalists waited upon him and asked him if he would stop selling stock if they would put up the money to carry his plans forward. They said they were going to Chicago and would return on Sunday night with $500,000, one-half of which they would immediately make subject to his draft. They were as good as their word, and Mr. Henkle says that he now has $250,000 to draw upon. He says that the company will be capitalized at $40,000,000, and $7,000,000 will be expected from all of the countries of the world as gratuities in the way of columns, etc., to be placed in the building. The plan also contemplates the construction of two railroads at a cost of $77,000,000, one to run from California to Maine and one from Manitoba to the St. Lawrence river. The *Buffalo Courier*, in giving the above, says that Mr. Henkle returned to Rochester for a few days.

Another company has appeared in the field for a franchise to conduct electric power throughout the city of Buffalo. "If the Niagara Falls Power company will not come to us we propose to go to them," say Jacob Musch and Thomas Murphy in a petition submitted to the street committee. The petitioners ask for a franchise to enable them to handle power subject to such reasonable restrictions as the Common Council may see fit to impose. They have undertaken to form a company with a subscription list of $1,000,000. Of this they say $100,000 has been subscribed within a few days, and, if the franchise is granted, they have assurances "that if necessary $5,000,000 will be subscribed for the purpose of this enterprise." The petitioners ask "the right, privilege and franchise to erect poles, lay conduits, and string wires in any and all of the streets, alleys and squares of the city of Buffalo for the purpose of supplying heat, light and power." They want the privilege of obtaining power "from any company, firm, person or persons engaged in transmitting electricity in Buffalo, Niagara Falls or elsewhere and to be allowed to connect wires for the purposes of such electrical transmission." The petition sets forth the purpose of the

new company to go to Niagara Falls if necessary and bring power to Buffalo. Alderman Bradish inclined to the belief that J. F. Schoelkopf of the Niagara Falls Hydraulic & Manufactnring company, the rival of the Cataract company, was behind the application for the new franchise. Mr. Murphy said he would be satisfied to have the corporation counsel requested to draw up the terms of the franchise.

Capitalists have swooped down upon the lively village of Depew, a suburb of Buffalo, and have bought nearly all of it. They are John Jacob Astor, H. Walter Webb, W. Seward Webb and H. McK. Twombly. There is much significance in this deal. It seems reasonable to suppose that the gentlemen named have obtained controlling interest in this company because there is a definite purpose to expend a very large amount of money in improvements. At Niagara Falls they control the production of what will be practically unlimited electrical energy. That this energy can be transmitted economically to Depew and there used in the various manufacturing concerns, there is no doubt. It is thought certain that there is some definite plan in view that will be developed soon for the construction of other great shops in addition to those already in operation at Depew.

A hearing has just been held before the mayor of Buffalo in reference to the Assembly bill which gives to Alonzo C. Mather the privilege to build a power bridge across the Niagara river at Buffalo for the purpose of developing electric power. A delegation of about fifty citizens was present at the hearing and not one word was uttered in opposition to the approval of the bill. After several had spoken in favor of approving it, Mayor Jewett took a vote and all who voted at all were in favor of giving to Mr. Mather the privilege he asks. Mr. Mather, the originator of the scheme, spoke for some time. In an affidavit Mr. Mather said that he had devoted much time and thought and quite an amount of property on both sides of the river with that end in view, and had expended nearly $7,000 in constructing working models, in drawing specifications and in American and Canadian patents, and in consultation with not only American engineers, but prominent engineers from Paris; that as a result of these investigations he believed that he was far nearer the solution of converting the power of Niagara river right at Buffalo into electrical energy than we are of transmitting it from Niagara Falls to Buffalo in commercial quantities. After the hearing Judge Daniels was interviewed and he said that the objection of the War Department could undoubtedly be overcome if proper assurances could be given that the bridge would not obstruct navigation. Mr. Mather said he had as yet made no bargain with the Canadian government, but he believed that it could easily be done. It would be a great advantage to Canada, and he thought the Canadian government would be quick to see it. It has been rumored that the Lehigh Valley railroad was interested in the scheme, but that rumor was emphatically denied. Assemblyman Braun went to Albany with the bill bearing the approval of the mayor of Buffalo and the citizens of this city.

F. C. P.

## Northwestern Notations.

MINNEAPOLIS, June 14.—The work of surveying for the electric line from La Crosse, Wis., to Neillsville, about 90 ninety miles, has been begun under direction of Fred H. Pickles, engineer of Winona Minn. The company will secure power from Black River Falls.

Shell Rock, Iowa, citizens want electric lights.

Mayor Born, of Sheboygan, Wis., has vetoed the resolution accepting the bid of the Sheboygan Electric Lighting company for ten years at $95 per lamp. Several months ago the company wanted to contract at the rate of $90 per lamp. The mayor, who was then alderman, opposed it and finally succeeded in having bids asked for, but only one was received, that of the company, at an advance of $5 per lamp. His veto is based on a clause in a former franchise in which the company contracts to furnish the city with light at as low a rate as is furnished in any other city where water power cannot be obtained.

The Anaconda, Mont., Electric Light & Power company is purchasing new machinery and will enlarge the plant to double its present capacity.

The trials of the Central Wisconsin Interurban Electric company are not over with the withdrawal of the competing companies from the field. The new company has been rushing work in Oshkosh, Wis., but the local street railway people executed a strategetic move by laying low until they had all materials on hand, when they suddenly began laying rails on North Jackson street, from New York avenue to the fair ground gate, a section for which the Central Wisconsin people claimed an exclusive franchise. They began work at 10 P. M., by the light of the moon, lanterns and headlights. When the opposition learned of this they sought the Board of Public Works and found the company had not secured permission to tear up the street, and was in violation of the ordinance. The chief of police then issued an order to the officers not to permit the Oshkosh Street Railway company to tear up the street in question, and ordered work to stop, but those in authority declined to obey and there was nothing further done to stop work that night. The Oshkosh Street Railway people had a franchise to that street some years ago, but had not built and operated it in the last five years, as provided by the ordinance. Their opponents claim that the franchise is void, but the City Council has never declared it void. The outlook for injunctions and legal battles generally is promising.

G. D. Barnett, an employe of T. P. Benton & Son's electrical machine shop in La Crosse, Wis., was instantly killed by the bursting of a wheel.

Madrid, Iowa, has voted a franchise for electric lights and telephones to J. P. Anderson.

An electric line between Waterloo and Cedar Falls, Iowa, is projected.

W. J. Diehl of La Crosse, Wis , secured a contract with Lanesboro, Minn., for an electric light plant.

The Consolidated Street Car company of Sheboygan, Wis., has contracted with C. E. Loss & Co. of Chicago for eleven miles of electric street railroad construction, to be done in sixty days.

Wheeler & Co. of Beloit, Wis., have applied for an electric light franchise at Rock Valley, Ia.

There is talk of an electric plant at Hallock, Minn.

The Sandstone Supply company has been formed to supply Sandstone and Hinckley, Minn., with light, heat and water.

W. J. Bell, an electrician of Winona, Minn., while stringing wires near Durand, Wis., had a narrow escape from death. He was at the top of a pole and a companion was guiding the wire through the top of a tree, when lightning struck the wire, and Bell saw his assistant come out of the tree like a flying squirrel. He had no time to assist him, for the next second he went down too. The bolt demolished the coil of wire which lay on the ground, but neither of the two was severely hurt.

Walter Lilly, a lineman in Dubuque, Ia., while working on a pole, got a shock and fell among the wires. A short-circuit formed through his body and blue flames played all over him. The current was shut off and after 20 minutes he was taken down. He will probably recover, though he is said to have received a current of 2,000 volts.

La Crosse, Wis., will have John A. Cole make an estimate of the cost of a municipal electric plant.

Electric cars are being considered in Ft. Madison, Ia.

The Butte Electric company is enlarging its plant.

The Consumers' Light & Power company has been incorporated at Spokane, Wash., with $250,000 capital.

W. N. Stewart of Minneapolis, representing the Siemens & Halske Electric company, is in Mankato, Minn., to negotiate for putting in a plant to operate the street railway and furnish light and heat. He proposes to absorb the present street car and electric company, if possible, and improve the plant, practically rebuilding it, or put in an entirely new plant. J. H. Finney of Minneapolis, representing the Fort Wayne Electric corporation, is also in Mankato, with a similar proposition.

Mayor A. C. Probert of Washburn, Wis., is in a very critical condition from receiving a current of 1,756 volts by falling on the dynamo in the electric light plant. He was unconscious for several hours, but hopes are entertained for his recovery.

An electric line from Fort Dodge, Ia., to "Wild Cat Cave" is proposed.

M.

## PERSONAL.

W. H. McKinlock, president of the Metropolitan Electric company, Chicago, has been enjoying a fishing expedition during the last week. On his return he brought with him ample evidence of his success.

B. J. Launiere, formerly secretary of the Grand Rapids Machinery & Electric company, has accepted a position as traveling salesman for the Metropolitan Electric company, Chicago. Mr. Launiere possesses remarkable ability and he is well liked by the trade.

Secretary A. D. Newton, of the Eddy Electric Manufacturing company of Windsor, Conn., was married to Miss Gertrude Hyde of Hartford, Conn., on June 12th. Mr. Newton, who is very popular among electrical men, is to be congratulated on his good fortune. Mr. and Mrs. Newton will be at home after October 1st, at 362 Laurel street, Hartford, Conn.

Henry C. Parmly, senior member of the real estate firm of Parmly Brothers, Chicago, and a member of the board of directors of the Standard Electric company from its inception, died recently. Mr. Parmly was born in Painesville, Ohio, in 1836, and educated in Ohio colleges. In 1860 he went to Paris and there formed a partnership with his cousin, George W. Parmly, a physician widely known in Europe, and the young firm gradually built up a large practice in medicine and dentistry among the nobility of France. Returning to this country in 1873, he was married to Miss Hattie Sumner, and shortly thereafter located in Chicago. Engaging in the real estate business, success attended his efforts, and at the time of his death he owned valuable properties in the heart of Chicago. Though of a quiet, retiring disposition, yet he was a charming companion, a loyal friend, an upright, wholesome and progressive citizen.

## TRADE NEWS.

L. M. Moyes, the manufacturer of the Combine safety water-tube boiler, announces that he has entered suit through his attorneys, Biddle & Ward of Philadelphia, against the Stirling Boiler company of Barberton, Ohio.

The reputation of the Meston standard type fan motor, manufactured by the Emerson Electric Manufacturing company, St. Louis, can well be judged from its output, which last week reached the 10,000 mark. The company has started on the manufacture of the second 10,000.

General Sales Agent P. C. Ackerman, of the American Electrical Works, has left his New York office for an extended trip through the central and western states. It is rumored that he took a trunk this time in order to have sufficient room for orders for the well-known products which he advocates.

The Louisville Electrical Works of Louisville, Ky., have established an eastern office at 203 Broadway, New York, in charge of J. A. Machado, who in the future will represent the company in New York and vicinity in the sale of the Phœnix transformer, which is rapidly making an enviable reputation.

The West End Railway company of Boston has recently placed an order with the General Electric company, covering two 800 kilowatt generators, two 1,300 kilowatt and one 1,500 kilowatt, all to be directly connected to the engines. This is one of the largest orders for railway generators ever placed at one time.

H. F. Kellogg, of W. B. Southgate & Co. of Boston, Mass., paid the New York office of the WESTERN ELECTRICIAN a call last week, on his return from a trip from the South. He reported an active condition of business through the South and stated that there was a prospect of a very bright trade in the future. This concern is now handling the entire product of two slate quarries, which they finish to meet all the requirements necessary in fine switchboards and other electrical furnishings.

Warren Webster & Co., Camden, N. J., specialists in examining steam plants where increased economy in fuel is desired by utilizing waste exhaust steam, report considerable activity in their business, by reason of a recognized appreciation of their manufactures in comparison with other apparatus for a similar purpose. Among the recent orders for the Webster "Vacuum" feed water heater and purifier, and in addition to numerous contracts for the vacuum system of steam heating, without back pressure upon the engine—Webster steam and oil separators—the firm reports contracts aggregating 10,000 horse power from the leading concerns in the country.

Chicago's electrical district is undoubtedly enlarging its territory on the south. A year or so ago the majority of Chicago's supply houses were in the district north of Adams street. Now a large number of concerns are to be found with their headquarters south of the postoffice, although there are still quite a number north of Adams street. Among the last to move into the southerly district is the New York Insulated Wire company. It will be remembered that this concern had its quarters at 80 Franklin street, but Western Agent J. Wolff felt that a more advantageous location would be in the southern district and moved to 320 Dearborn street. Mr. Wolff without doubt has made a good selection of offices. The headquarters at 320 Dearborn street are between Van Buren and Harrison streets, and the offices occupy the entire ground floor through to Custom House place. The suite consists of Mr. Wolff's private office, the general office, and a commodious store room at the back; a large dry cellar, too, admits of the storage of a full stock of wire. With such conveniently located quarters, and so genial and energetic a representative, it is easily understood how the New York Insulated Wire company feels so much encouraged over the prospects for business. The fact that Mr. Wolff carries a full stock of wire in Chicago goes a long way toward enabling him to add to that growing business so largely due to his popularity.

## BUSINESS.

The Hemingray Glass company of Covington, Ky., is still supplying the electrical trade with a large proportion of its glass insulators. Various sizes and styles are made, and all give satisfaction.

H. H. Harrison has acquired an interest in the business of R. B. Corey, Havemeyer building, New York, and will be associated in the active management. Mr. Harrison was for several years prominently connected with the White-Crosby company, contracting engineers of New York.

The Wagner Electric Manufacturing company, St. Louis, is endeavoring to keep pace with the demand for its well-known transformers and fan motors, but although its force is working overtime the company is considerably behind in its orders. The prospects for a large fall trade are very bright.

E. Kuhlman, of the Kuhlman Electric company of Elkhart, Ind., was in Chicago on Monday. He is exploiting the Elkhart transformer, which, with its high efficiency, low leakage, good regulation, simple construction, durability and removable coil, seems to be meeting the success it deserves.

General Manager Hugo Bendix, of the Boudreaux Dynamo Brush company of New York, reports that the orders for June are far ahead of May, and from nearly every customer duplicate orders are being received. Testimonials of the perfection of this dynamo brush are being compiled for publication. These letters are numerous and from prominent

central station managers. J. W. Brooks & Co. of San Francisco, Cal., have been appointed sole agents for the Pacific coast.

The Julius Andrae & Sons company of 225 West Water street, Milwaukee, is doing a booming business in telephones and telephone supplies. The celebrated Milde microphone is used in all the Andrae telephones. Milwaukee papers report that Mr. Andrae has purchased the buildings at 162 to 168 West Water street for $125,000 in cash.

The Electric Appliance company, Chicago, has succeeded in securing the general western agency for another very desirable specialty, a staple article for which there is a big demand. Its control and sale in the West by the Electric Appliance company is considered a very desirable arrangement. A large Chicago stock will be carried, placing the company in a position with facilities possessed by very few supply houses in the country. The company promises a big surprise when it announces the particulars of this deal through the advertising pages of the WESTERN ELECTRICIAN.

The annual catalogue of the Law Battery company of New York is always expected to contain full data regarding primary batteries and their attendant appliances. The catalogue of this concern for 1895 is one of the most complete publications of its kind ever issued, containing an exhaustive treatise upon batteries and profusely illustrated throughout, making a very desirable book of reference upon this subject. The Law Battery company has recently erected a factory at Cranford, N. J., where it manufactures all parts pertaining to their battery cells and various lines of medical apparatus. This company will continue to push to the front its "old reliable" battery.

Nations may be ungrateful, but the chief officials in our western cities are not so constituted, judging from a letter received by the Standard Electric company, Chicago, from which the following extract is taken: "The (Standard arc) dynamo we bought of you has been in constant use in all-night service, since November, 1893, and has not cost one cent for repairs. I find it much more economical to operate—in the amount of power required—than any other dynamo we use." The Standard company during the last few months has installed nearly a dozen municipal lighting plants, including one for the city of Springfield, Illinois, having a capacity of 700 arc lamps; one for the town of Newton; one for the city of Logansport, Ind., and one each for Paducah, Ky., Fulton, Mo., Jamestown, N. Y., Harrisonville, Mo., Independence, Iowa, Willoughby, Ohio, Kearney, N. J., and Chesaning, Mich.

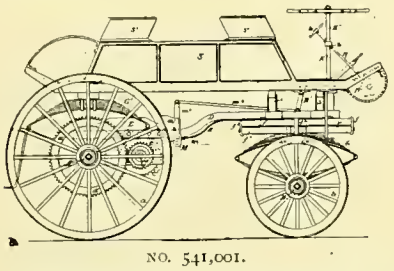
# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued June 11, 1895.*

540,620. Electric Circuit. William W. Alexander, Kansas City, Mo. Application filed March 24, 1890.

The combination consists of a relay provided with front and back contacts, its armature, a battery, a sounder, and a switch in the sounder circuit, a signal controlling device having a toothed wheel and pawls on a division of the battery circuit, and operated by the back contact of the relay. The sounder and signal controlling device are operated by the same battery without interfering with each other, and a different or contrary action is produced by the line pulsations upon the sounder from that upon the signal controlling device.

540,642. Automatic Electric Railway Signal. William Daves, Jersey City, N. J. Application filed February 14, 1895.



NO. 541,001.

This apparatus comprises a rotative signal staff and a commutator, a track circuit, a signal controlling magnet in the track circuit adapted to be cut out of circuit by the presence of a train on the track section, a relay interposed in the track circuit and adapted to stand open and be cut out when the track circuit is employed to charge the signal magnet, and to be closed when the train has passed from the track section, and a signal operating battery circuit, having a signal magnet interposed therein and completed by having one of its lines through the contact piece of the relay to the signal magnets, so that when the train has passed from the track section the track battery will energize the relay, and the signal battery will energize the signal magnet to operate the signal mechanism, after which the relay and signal and signal-battery circuits are broken and the signal held at safety by the track circuit.

540,653. Supply System for Electric Railways. Oscar A. Enholm, New York, N. Y. Application filed November 3, 1891.

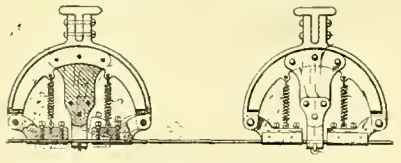
This arrangement is composed of a group of electro-magnetic circuit controllers outside of the roadbed, and arranged to be easily accessible, each controller being electrically connected with one exposed terminal head in the roadbed.

540,664. Electric Railway. Sebastian Hoeninger, Milwaukee, Wis. Application filed August 15, 1894.

In the cut is shown the combination of a suspended yoke, an insulated hanger central of the same, insulators pivoted to the ends of the yoke, and trolley wire sections secured to these pivotal insulators to normally lap each other in the insulated hanger.

540,668. Regulation of Alternating Generators. Rudolph M. Hunter, Philadelphia, Pa. Application filed June 21, 1894.

The cut shows an arrangement including an alternating current generator, line circuits leading therefrom for supplying energy to translating devices at distant places, a separate continuous current generator or exciter, an exciting circuit leading from the continuous current generator for supplying current to the field magnets of the alternating current generator, a regulating armature for generating counter-electromotive force arranged in the exciting circuit, field magnets for producing a magnetic field in the vicinity of the regulating armature, and adjustable devices for shifting the poles of the regulating armature relatively to the poles of the field magnets for the purpose of varying the speed of the regulating armature, and thereby controlling the counter-electromotive force.



NO. 540,664

540,685. Electric Brake. William B. Potter, Schenectady, N. Y. Application filed March 9, 1895.

A controlling switch, a brake switch, a reversing switch, an interlocking mechanism between the switches, and means arranged to vary the effect of the interlock in accordance with variations of position of one of the switches are features of this invention.

540,781. Telephone Transmitter. Daniel Drawbaugh, Eberly's Mill, Pa. Application filed February 16, 1895.

One claim is given: In a telephonic transmitter, the combination with the body having the central opening, the diaphragm and rear plate of the electrodes, a felt pad held in the central opening in the body and surrounding the electrodes to form a chamber between them, and comminuted resistance conductor located in the chamber.

540,800. Electric Arc Lamp. Samuel P. Parmly, Chicago, Ill. Application filed October 26, 1891.

A pair of carbon pencils for an arc lamp is adapted to be presented end to end, and to be adjusted toward one another as they are consumed by an arc passing between them, formed each as a flattened bar or prism thickest at the middle and becoming thinner toward the edges.

540,859. Electric Railroad Signal. Burton H. Gedge, Anderson, Ind. Application filed May 20, 1892.

In a system of electric signals, the combination of the lines of rails, each line separated at desired intervals by forming divisions, and there connected to an electro-magnet, in connection with the source of electrical energy, and other intervals between the first named insulation, also electrically insulated, and the lines of electric conductors separated near the electro-magnets, and capable of being put into circuit by the circuit closers, adapted to be closed by the electro-magnets, the mechanism being a part of a system of which locomotives provided with electric signal devices are the complementary part.

540,883. Trolley. William E. Steinbach, Philadelphia, Pa. Application filed April 6, 1895.

A trolley formed with auxiliary rollers which are adapted to engage with the trolley wire, and a crank arm for separating the rollers to permit the same to be disconnected from the wire, is shown in the accompanying illustration.

540,899. Telegraphic Apparatus. Louis Bondet and Pierre Lacombe, Lumel, France. Application filed October 20, 1894.

In the transmitter described there is the combination with a suitable dial, of a plurality of hands carried by shafts concentric one with another, a toothed wheel secured to each of the shafts, a plurality of electrically conducting circuits similar in number to the wheels, shafts and hands, and a vibrating contact making and breaking strip located adjacent to each of the toothed wheels, so as to be vibrated by the rotation thereof and forming part of one of such conducting circuits.

540,900. Condnit Electric Railway. David Brooks, Jr., Philadelphia, Pa. Application filed June 9, 1892.

The principal parts in this device are a condnit with slot, an insulating support on hangers in the conduit, a continuous conductor on the support, insulating strips on the continuous conductor, a sectional conductor with separated ends on the strips, pieces connecting the ends of the sections and the continuous conductors, a receiver movable in the slot, a frame protecting the receiver, and a chain secured to the receiver and in contact with the sectional conductor.

540,901. Conduit Railway Conductor. David Brooks, Jr., Philadelphia, Pa. Application filed February 27, 1892.

This is a continuous conductor, sectional conductors and insulating material between the continuous and the sectional conductors, and pieces of fusible material electrically connecting each of the sections with the continuous conductor.

540,959. Telephone Transmitter. Daniel Drawbaugh, Eberly's Mill, Pa. Application filed February 23, 1895.

This transmitter has a fixed and a removable electrode, a body of granular carbon interposed between the electrodes, an elastic carbon holder having an opening of a size to fit the electrodes, thereby to keep the granular carbon in operative position with relation thereto, and means for adjusting the removable electrode to and from the fixed electrode and locking it in its adjusted position.

540,960. Carbon Holder for Telephones. Daniel Drawbaugh, Eberly's Mill, Pa. Application filed February 21, 1895.

A carbon holder for telephone transmitters, comprising an annulus wholly of sponge.

540,961. Telephone Electrode. Daniel Drawbaugh, Eberly's Mill, Pa. Application filed February 21, 1895.

A closed casing, a disk-like annulus filling the space between sides of the casing, carbon buttons within the casing of a size to fit the opening in the annulus, and a body of granular carbon interposed between the buttons.

540,969. Telephone. Stephen D. Field, Stockbridge, Mass. Application filed December 5, 1894.

A magneto telephone is described, having two independent circuit windings in inductive relation to each other, one of the windings being in mechanical connection with the diaphragm and forming a closed circuit complete in itself, and the other being adapted for connection in a main line circuit.

540,974. Multiplex Telegraphy. Daniel B. Grandy, St. Louis, Mo. Application filed December 17, 1894.

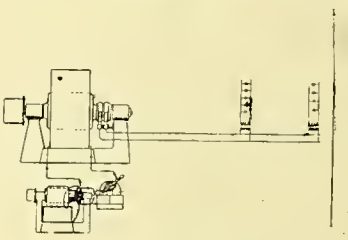
In a quadruplex or multiplex telegraph system, the combination with the main line circuits, the means for producing signals simultaneously in each direction by changing the polarity of the line currents, and the means for producing other and independent signals simultaneously in each direction by varying the strength of said line currents, of an additional resistance in the form of coils differentially wound on iron cores, condensers shunted around said resistance, and electro-magnets connected in said shunt circuits with said condensers around said resistance, so that said resistance offers but little impedance to outgoing currents beyond its ohmic resistance, while incoming currents encounter a high impedance from the self-induction therein, and a stronger charge is thereby caused to enter the condenser in one of said shunt circuits.

540,999. Electrically Driven Fan. Henry G. Morris, Philadelphia, Pa. Application filed February 9, 1894.

The invention as described combines a base, an electric motor thereon, a vertical driving shaft, a disk on the shaft, a series of blades extending above and below the disk at its periphery, a ring inclosing a portion of each of the lower blades, and another ring inclosing a portion of each of the upper blades, the rings forming an annular space between them, and the driven disk forming a deflector.

541,001. Electric Carriage. Henry G. Morris and Pedro G. Salom, Philadelphia, Pa. Application filed January 19, 1895.

The details of construction are shown in the illustration. The first claim is reproduced: The combination in an electric carriage, of the rear axle, the driving wheels thereon, the front



NO. 540,668.

axle and wheels, a frame attached to the rear axle, a ring section on the front of the frame, springs on the front axle, a ring section carried by said springs, a body attached to the frame at the forward end springs mounted between the frame and body at the rear, an electric motor carried by the frame, an intermediate shaft mounted in bearings on the frame, pinions on the shaft, and gear wheels on the driving wheel meshing with the pinions, and equalizing gearing between the motor shaft and the intermediate shaft.

541,019. Electric Wire Lock and Support. Daniel W. Smith, St. Louis, Mo. Application filed September 10, 1894.

A suitable trolley wire hanger is employed in combination with the guy wire clamp, having a transverse recess in its upper side, a lateral enlargement of the recess, downwardly curved side-grooves intersecting the recess at their inner ends, and together extending continuously from end to end of the clamp, and a suitable pivot passing through the lateral enlargement of the recess and engaging the trolley wire hanger, so that the head of the pivot will be located below, but out of contact with the overlying guy wire.

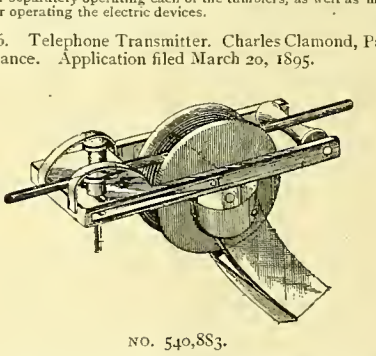
541,020. Conduit Electric Railway. Daniel W. Smith, St. Louis, Mo. Application filed September 10, 1894.

A loop is formed integral with and in the length of the conductor at the crossings of the conduit, the loop comprising the vertically bent portions, horizontally bent portions and the circular loop all bent from the length of the conductor.

541,024. Electro-magnetic Combination Lock. Emory Stockwell and Herbert C. Stockwell, Stamford, Conn. Application filed August 6, 1894.

A series of independently operated tumblers are adapted to control the fence, while an independent electric device is provided for separately operating each of the tumblers, as well as means for operating the electric devices.

541,036. Telephone Transmitter. Charles Clamond, Paris, France. Application filed March 20, 1895.



NO. 540,883.

Included in this device are a movable electrode and sound receiving diaphragm in a telephone circuit, an adjacent receptacle, a bridge within the receptacle, a plastic, viscid, conducting paste contained within the receptacle, and a loosely supported ball encompassed by the paste and maintained in the described relation to the movable electrode.

541,037. Telephone Transmitter. Charles Clamond, Paris, France. Application filed March 20, 1895.

A pendulous electrode is suspended within plastic, viscid microphonic conducting paste, in combination with a vibratory diaphragm electrode between which and the suspended electrode the paste intervenes.

# Western Electrician.

EVERY SATURDAY.

Vol. XVI. CHICAGO, JUNE 29, 1895. No. 26

## James E. Keelyn.

In the struggle for supremacy in the pending telephone litigation and consequent control of the situation, one of the most active leaders of the anti-Bell forces is the subject of this sketch. James E. Keelyn was born at Albany, N. Y., 38 years ago, and came to Chicago when a mere boy. For 30 years he has lived in the West, and much of that time in Chicago. He may, therefore, be justly considered a typical western business man, enterprising, energetic, resourceful, and keenly alive to the advantages offered in the opening up of the telephone field to the public. He has become thoroughly familiar with the Bell policy and methods through long service with that company, and his knowledge of that concern's great resources, and his willingness to enter the field against that corporation, shows his confidence in the ultimate success of the anti-Bell crusade.

Mr. Keelyn became interested in telephony at an early day in the history of its commercial life. He entered the Wisconsin Telephone company when it was formed, and was manager of the Racine exchange from 1880 to 1885. In May of the latter year he engaged in business independently, but continued to keep in touch with the telephone situation. His experience in general electrical construction business gave him a wider acquaintance, and was valuable in other ways. Anticipating the expiration of valuable patents held by the Bell people, he began his preparations to re-enter the telephone business, and in 1890 formed the Western Telephone Construction company of Chicago, of which he is president. He has devoted much time and study to the Bell company's policy, methods, and the system of that corporation, and is probably as well equipped as any man in the country to lead the opposition to the old concern. He has succeeded in gaining the confidence of many representative telephone men, engaged like himself independently of the Bell company in developing the telephone field, and with their assistance he formed the anti-Bell organization known as the Telephone Protective Association of America, which has been in consultation at Pittsburg this week.

It is a noteworthy fact that Mr. Keelyn is conservative in his business methods, and that this movement which he is now leading is intended for the protection of the members against attacks by the Bell company rather than an effort to stir up prejudice against the old corporation. It is his belief that the telephone field is too extensive for one company to control if the full possibilities that are offered are to be developed, and in support of this position he cites the fact that while the Bell company has made phenomenal progress in introducing and extending this business, it has not begun to exhaust the possibilities presented. It is not to be inferred, however, that this conservatism of Mr. Keelyn will prevent him from stubbornly opposing every effort of the Bell company to once more monopolize the field and retaliate every attack that is made upon him or his associates. His record already establishes the fact that he is ready to defend his interests, and that he is full of expedients and measures with which to meet his powerful opponent.

Socially, Mr. Keelyn is a very pleasant and agreeable companion, and enjoys popularity and confidence in the community. He has a pleasant home at Evanston, Chicago's favorite suburban town. In 1885, Mr. Keelyn married a daughter of David Lawton of Racine, Wis. He is very much attached to his family, which comprises his wife and one son.

## Telephone Competition in Wisconsin.

After trying without success to get a franchise in the city of Berlin, Wis., the Badger Telephone company finally entered that place without a franchise. After reaching the city limits, the workmen set poles on private land as far as they could, and then set them on the river bank, on government land. From the river the wires were strung from building to building, wherever permission could be obtained, and the company put in some telephones. Two other telephone companies had been granted franchises in Berlin, and the city officials did not care to grant any more franchises because the city was in danger of being made unsightly by too many poles. The Badger company operates a line through Waushara county and so does another company which has quite a large exchange in Berlin.

The Oshkosh Northwestern Telephone company has accepted the franchise which was granted to it at Oshkosh, and there is some indication of rival lines in that city before a great while.

## Telephone Protective Association.

A dispatch from Pittsburg, June 24th, says: "An adjourned meeting of the executive committee of the Telephone Protective Association of America, recently formed in Chicago, held an executive session for the purpose of completing its organization and plans. The association embraces about 40 telephone manufacturing concerns and plants. It is not a corporation; it is not a trust. It owns neither stock nor patents. It is an association designed to protect and further the interests of its members, and it proposes to prove that the earth and the fullness thereof doesn't belong solely to the American Bell Telephone company, and to that end will stand between it and other companies, users and exchanges.

"The officers so far elected are: President, J. E. Keelyn

JAMES E. KEELYN.

of the Western Telephone Construction company of Chicago; first vice-president, J. R. Johnson of the Viaduct Manufacturing company, Baltimore; second vice-president, S. J. Tunbridge of the Utica, N. Y., Fire Alarm & Telephone company; secretary, Paul W. Bossart, Minneapolis, Minn.

"On the executive committee, so far as consummated, are: P. C. Burns of the American Electric Telephone company of Kokomo, Ind.; J. G. Ihmsen of Pittsburg; H. C. Dodge of the Standard Telephone & Electric company of Madison, Wis.; L. Levick of the Anthony Telephone company of Cincinnati, O.; Judge E. S. Wallace of the Columbia Telephone company of New York. The association adopted its constitution and by-laws in part, and it expects to conclude the organization and plans at this meeting. The association looks upon the long-distance telephone in the light of a common carrier and proposes by legal measures to compel the company to accommodate local exchanges with connections. The association thinks the Bell patents much weaker than claimed. President Keelyn stated that an association of independent telephone companies of Pennsylvania is about to be formed. The committee was entertained by the Country club."

## Telephone Rates in Chicago.

For many years there has been much dissatisfaction with the telephone rates in Chicago, and the Druggists' association has made several ineffectual efforts to secure relief. At the present time an organized movement is on foot to compel the Chicago Telephone company to reduce the present charges to a reasonable basis. The local agitation is being conducted through the *Chicago Chronicle*, and, judging from the expressions of approval and encouragement found in the interviews with business men in all lines of trade, the movement is welcomed with universal favor. Commenting editorially upon the subject the *Chronicle* says:

The officials of the local telephone company lay stress upon the fact that it costs more to serve 15,000 subscribers than 200. This is doubtless true.

But it is also true that the 15,000 subscribers pay more—proportionally and disproportionally—for their 'phones. In a 200 'phone exchange $50 a year is a high rental, making an income for the company of $10,000 a year. In Chicago, with 15,000, it is moderate to put the average rental at $100, or $1,500,000 a year gross income. It is the only business in the world which demands bigger profits with larger sales. There is neither logic nor justice in the position of the telephone company.

No sane business man—and the *Chronicle* is representative of the sane business sense of the community—will deny to the telephone company the right to make a reasonable profit on its business, or, if it were subject to free competition, the right to make even an unreasonable profit. But, as there can be no competition, as the council has shut the streets of Chicago against competitors—as the very nature of the telephone business makes effective competition impossible—some public supervision of charges is essential.

Only united action will crush the telephone monopoly. Competition won't do it in a great city. The law offers no remedy. Nothing but enforcement of the public right to control and, if need be, to take and manage the telephone system will be effective. This in the present fiscal condition of the municipality is a simple impossibility. But the city can regulate charges, and if it is true to public interests will do so.

## Bell Instruments Replaced at the National Capital.

[From the Washington correspondent of the WESTERN ELECTRICIAN.]

The District government proposes to operate a telephone system of its own, and thereby cease paying the Chesapeake & Potomac Telephone company for such service. The proposal of Kennedy & Du Peraw to furnish 200 sets of telephone transmitters and receivers at $3.75 per set was accepted. The usual indemnity bond to guarantee against infringements will be given by the Manhattan Supply company, the maker of the telephone sets. The new system will be put into working order shortly after the beginning of the next fiscal year. The District already owns the wires necessary for the police and fire alarm service, which for the most part is that for which the government rents telephones, to the number of 200, at a rate of $2,000 yearly. The exchange telephones, sixteen in number, and the exchange service, now paid for at a total of $350 per annum, will be kept.

A company to be known as the Columbian Standard Telephone company has been organized in this city, with L. G. Hines as president, Felix Agnus vice-president, and George W. Cross as general manager. The company is to operate in Maryland, District of Columbia, Virginia and West Virginia.

Another dispatch under date of June 24th says of the movement against the Bell company:

The commissioners are so well pleased with the success of their experiment that an effort will at once be made to extend the system, and, if possible, enter into direct competition with the Bell company, which until now has practically owned Washington.

For a town of its size Washington has been paying higher telephone rates than any other city in the East. It is the claim of the Bell company that in small towns it is able to charge quite reasonable rates, because of the limited number of subscribers. Washington's population in round figures is 200,000, while Chicago's is 2,000,000, yet the telephone charges in this town closely approach, and in some cases exceed, the rates charged in Chicago. The lowest price for which a telephone can be obtained for business purposes in this town is $100, although the total number of subscribers is not within one-eighth of the number in Chicago. The Washington telephone directory is a limp booklet of less than ninety-five pages of actual names, printed in staring big type. It contains probably the names of 2,000 subscribers, many of them duplicates. Many of the subscribers realize that the rates they have been paying are altogether too high, but nothing has been done to bring the company to terms.

In most cities the telephone companies are required to furnish service to the city free in part payment for its franchise. This is not done in Washington, although a heavy percentage of the telephones are in use by the government and the commissioners. The District was obliged to put in its own wires, batteries and bells, but was forced to hire the transmitters and receivers from the Bell Telephone company. For the privilege of using these instruments the District had to pay $10 a year for every set it used. The government has to pay full rates of $100. The rate charged the District would, it is understood, have been continued, had not the Bell company feared competition. Since April the rent has been reduced to $5, a practical concession that the former

rate was exorbitant. Superintendent Miles, in charge of the telegraphic and telephone service, had repeatedly recommended to the commissioners that they should purchase the instruments and so obtain control of the entire system. Lack of money has prevented this in the past and would have prevented it again had it not been discovered that instruments could be purchased outright for less money than the Bell company charged for the hire of them.

The first batch of the new instruments arrived two days ago. Workmen are now engaged putting telephones into every department in the district. The telephones will be made to connect with an exchange and the system will be enlarged to whatever extent the appropriation permits.

## Telephone News from the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

Superintendent Wainman of the Minneapolis office of the Northwestern Telephone Exchange says business has picked up considerably in the past few months, particularly for May, and that June is expected to run ahead of the record.

The Mankato Telephone & Telegraph company of Mankato, Minn., has been absorbed by the Phœnix Construction company of Indianapolis, Ind., and the latter company will apply for the franchise asked by the former.

A 13 mile telephone line connecting Sparta and Cataract, Wis., will be built by D. W. Cody.

The Standard Telephone company has applied for a franchise at Madison, Wis. The company has a list of 200 subscribers and 100 additional contingents and says it does not fear the old company.

The Wisconsin Telephone company has begun the work of rebuilding the system of Oshkosh, Wis., and will put in heavier wires and the return circuit system. It will cost $16,000.

The Forman Telephone company of Forman, N. D., has incorporated, with W. W. Bradley as president; Jas. Anderson, vice-president; and A. N. Carlblom, secretary, and A. M. Grover, treasurer. The company has over 75 miles of wire in operation and has just completed the line to Lisbon.

The Northwest Engineering company of St. Paul is building the telephone line between Ortonville, Minn., and Big Stone City, S. D.

A telephone company has been formed at Cherokee, Ia., and will put in the Bell system.

W. J. Bell of Winona, Minn., is building a telephone line to Fountain City and the Waumandee Valley.

The Northwest Engineering company of St. Paul is canvassing Fairmount, Minn., to put in a telephone exchange.

---

A dispatch from Washington says that strenuous efforts will be made in the next Congress to induce the government to appropriate enough money to establish an electric plant at the Great Falls of the Potomac on lines similar to but less extensive than those at Niagara Falls.

The Seattle Consolidated Electric Street Railway company's power plant was destroyed by fire on the morning of June 20th, causing a loss of $75,000 to the company, insured for $40,000; and a further loss to the Third street electric line of $25,000, fully covered by insurance.

## A Central Station With Three-phased Current Generators.

By Dr. G. H. Zahn.

Electric light and power plants increase so rapidly that there is no keeping pace in describing them. All that we can hope to do is to mark the principal points and record the chief novelties of central station work. The plant here described is the central station owned and controlled by the city of Chemnitz, Germany, and comprises a system of high tension three-phased alternating currents with the necessary transforming apparatus.

The buildings, situated out of the town, are divided into boiler house and dynamo house, with generating room, workshop, etc.

Three Steinmueller water-tube boilers built for a working pressure of 180 pounds and provided with Leach's automatic coal feeding and stoking device furnish the steam required for driving the steam engines.

In the generating room are three vertical triple-expansion (three cylinders) condensing engines each yielding 150 horse power at 150 revolutions per minute and 165 pounds boiler pressure, the maximum output of each engine being 220 horse power. They were built by Kuhn of Stuttgart.

Directly connected with the shaft of each engine is the field magnet system of a Siemens & Halske three-phased alternating current generator built for an output of 180 kilowatts at 2,000 volts, and keyed to the same shaft is the armature of the small direct current dynamo furnishing the exciting current, at 120 volts, for the large generator.

The stationary armature as well as the revolving field magnets are built up of insulated sheet-iron stampings. The armature ring is firmly held together by steel bolts in a cast-iron frame. The windings are placed in grooves or channels at the inside of the ring, and generally there are three grooves per magnet pole. For insulation mica and fiber are used exclusively.

The field magnet system coupled to the shaft of the engine consists of a great many poles, the number of which varies according to the size and speed of the generator. There are 40 poles in the 180 kilowatt generators; thus, at 150 revolutions per minute of the machine, giving 3,000 cycles per minute.

The method of the armature winding is shown in Fig. 2 for a generator with 12 poles. Beginning at the back of the armature the wire is placed into channel *1* to the front, then going to *4* and through channel *4* to *1*, thus forming one turn. This process of winding is repeated as often as turns are required in one coil. In the same way coils are wound through *2* and *35*, *3* and *6*, *5* and *8*, etc. If a high tension is to be produced the coils $A_1$ to $A_6$ are connected in series; also the coils $B_1$ to $B_6$ and finally $C_1$ to $C_6$. The ends of these three groups of windings are connected in the neutral point, while the beginnings connect to the three terminals of the machine. Fig. 3 shows the way of connecting described and known as star winding; another method of making the connections, which might have been used just as well, the mesh winding, is illustrated in Fig. 4.

Very interesting are the curves of the voltage taken from the 180 kilowatt machines under varying loads. The diagram in Fig. 5 represents the voltage of the exciter, showing regular fluctuations or periods caused by the reactions of the armature and being six times the number of the periods of the exciter.

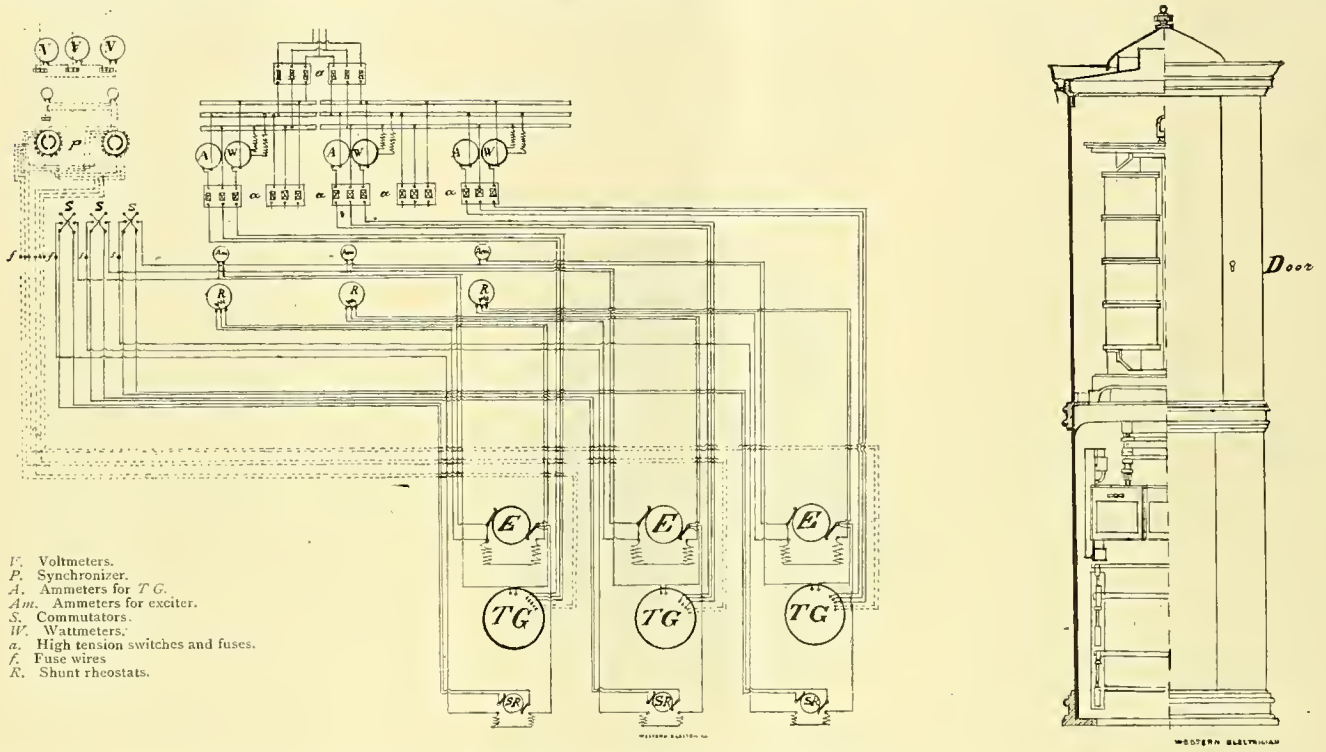
The curves of the three-phased current machines when running without load and with full load are represented by Fig. 6 and Fig. 7 respectively. It will be seen that for the generator when running without load the maximum pressure is a little lower than the maximum of a sinusoidal curve of the same effect. For 2,000 effective volts the maximum pressure as represented by a sine curve is 2,828 volts, while the diagrams taken from the machine show 2,788 volts for the unloaded and 2,930 volts for the loaded generator.

These diagrams are taken with an apparatus designed especially for this purpose, the main parts of which are a small three-phased current motor, a condenser and a reflecting galvanometer. The magnet system of the motor is supplied with current of the generator the curve of which shall be determined, while the armature is supplied from a direct current machine (exciter), thus securing synchronism of the motor. The motor shaft is provided with contacts and contact rings connecting the generator to be examined at every revolution at first with the condenser and then with the galvanometer. At every revolution the condenser is charged with a pressure corresponding to the variable positions of the contacts and then discharged through the galvanometer. If the motor be running with a high speed, the galvanometer will give a constant deflection of the mirror or the needle.

The dropping of the voltage of the generator is 7 per cent. if the load be changed from zero to the full output and if the exciting current be kept constant at 120 volts. The regulation of the large machines is effected by a small rheostat in the shunt magnet winding of the exciter. The power consumed in the field magnets of the generator and furnished by the exciter is about 3 per cent. of the power developed by each generator, the economical efficiency of which is 92 per cent.

In a corner of the generating room the switching arrangement is placed on a platform. A sketch showing the connection with the machines is given in Fig. 1. It will be seen that for each of the three sets of machines, the following controlling apparatus is used: For the exciter, one shunt rheostat, one ammeter; for the three-phased current generator, one three-pole switch, one ammeter and one wattmeter. The additional instruments for the entire plant are three voltmeters for the low tension mains and one synchronizer for putting the alternators in parallel.

It is an interesting feature of the arrangement that the small (pilot) transformers generally used as synchronizing apparatus and for the measurement of the secondary voltage are done away with. The armatures of the three-phased generators are provided with a few turns of an additional



FIGS. 1 AND 8. A CONTRACT STATION WITH THREE-PHASED CURRENT GENERATORS.

winding, yielding about 25 volts, and the terminals of this winding are directly connected with the synchronizer as shown by the dotted lines, while pilot wires connect the low tension mains with the controlling voltmeters.

In Fig. 1 $S$ $R$ represent small direct current motors used for the regulation of the steam engines and supplied with current from the exciter; $T$ $G$ are the three-phased current generators and $E$ the exciters.

From the central station, which is about one mile from the center of the district of the chief supply, two triple con-

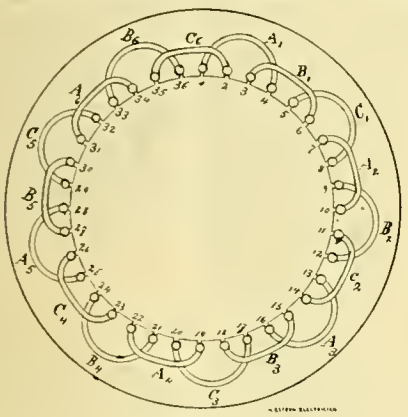


FIG. 2. A CENTRAL STATION WITH THREE-PHASED CURRENT GENERATORS.

centric lead-covered cables supply the transformers in the inner city branched cables connecting to the transformers situated in the outer parts of the town. The cables and the network of mains radiating from the sub-stations are constructed to supply 10,000 16 candle power lamps in actual operation.

There are at present 24 transformer sub-stations of 600 kilowatt capacity, reducing the voltage from 2,000 to 120 volts. The transformers and the high and low tension switching and safety arrangements are placed in iron columns about 12 feet high and 3.6 feet in diameter. All columns are of the same size—although the transformers are of different sizes, according to the output required—and are roomy enough for a 50 kilowatt transformer. In Fig. 8 one of these transformer cases is illustrated. It will be seen that the interior is divided into two parts, the upper one containing the transformer, the lower one the switches and fuses.

The transformers consists of three vertical columns (magnet cores) made of insulated sheet-iron strips, which are placed in a position corresponding to the corners of a triangle. They are wound on fiber spools around the cores, and the magnetic circuits are closed by sheet-iron strips magnetically connecting the cores on the top and the bottom, respectively.

A fairly good idea of a sub-station switchboard, the safety devices and connections of a transformer, may be gathered from the diagrammatic sketch, Fig. 9.

Light as well as power is supplied from the station, and the rates charged are of very great interest.

The price of 1,000 watts per hour is about 17 cents for lighting and 4.3 cents for power purposes. If time meters be used in connection with motors, the rate is about 3.3 cents per horse power per hour.

The motors operated in connection with the central station are of different types and makes. The stationary magnet ring of Siemens & Halske three-phased current motors is constructed and wound the same as the stationary armature of the generators described. In the inside of the magnet ring the revolving ring armature, made of laminated iron disks, is placed. The clearance between the magnet and armature iron is very small, to reduce as well the current required when the motor is running without load as the phase difference between current and voltage. The method of the armature winding is the same as in the magnet ring, the coils being placed in grooves on the outside diameter of the armature core. The ends of the three groups of armature windings are connected together; the beginnings are also put together in all small motors, and in large motors if current for power purposes only be supplied from the generator. If the central station furnishes power from the light mains it is better to connect the beginnings of the armature windings with three contact rings, brushes making connections with a suitable starting rheostat. All the resistance is in the armature circuit when the motor is started, thus reducing the current induced in the armature windings and the dropping of the voltage in the secondary transformer (light) circuits. With the increasing load the resistance is gradually diminished, and when the motor is running with full load the whole resistance is switched out and the armature practically short-circuited.

The difference in the speed of the motors running without load and with full load is from 2 per cent. to 3 per cent., the commercial efficiency is just as high as in good direct current motors of the same size, as may be seen from the following table:

Normal output of the motor four horse power:

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Output in horse power. . . | 0.5 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| Efficiency in per cent. . . | 50 | 68 | 83 | 87 | 87 | 87 | 87 | 86 |

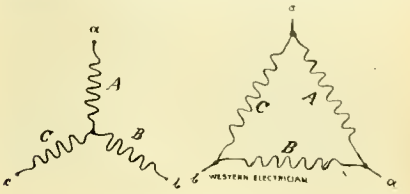
## Electric Railway Lines of the Chicago City Railway Company.[1]

If time is money, the saving in time for the passengers on the old horse car lines of the City railway, after that company has completed the conversion of those lines into electric roads, will represent a vast fortune. Thirty million passengers ride each year on the lines of the City railway, which have until within a few months been operated with horses. The conversion of those roads into trolley lines makes a saving in some cases of more than one hour in the time schedule from one end of the road to the other. It would be a fair estimate, perhaps, to say that passengers on the old horse car lines will be saved on the average 20 minutes each when the company has completed its electric work. That means a total saving of 10,000,000 hours in a year, or 1,250,000 eight-hour days. It means the time of 4,166 men working through a 300-day year. The story of the electric road development on the South Side is an important chapter in a history of this era of electric road building which is bringing such rapid changes in the city's development.

When the City Railway company has completed the electric railway construction that it is now engaged in, trolley cars will be running on 125 miles of its lines. Not a single horse car line will be left. The time that passengers have consumed in getting from one point to another will be decreased to a surprising amount. A passenger at Sixty-ninth and Leavitt streets will reach the business center one hour and 18 minutes sooner than he could have done under the old horse car schedule. An Auburn Park passenger, starting from the end of the Seventy-ninth street line at Halsted street, will be whirled down town at a speed that will save him one hour and 12 minutes, compared with the easy jogging of the street car horses. Passengers from the Union Stock Yards will spend 34 minutes less time jolting over street car rails than they have been forced to while the horses pulled them a portion of the way.

It requires an average of eight to 10 horses to operate every car on a line where the horse is the motive power. The substitution of electricity on all the horse car lines of the City Railway company will throw out of service 3,000 horses.

The work of converting the horse cars into trolley lines was begun last fall. On July 16, 1894, the City Council passed a handful of ordinances granting the right to convert horse car lines into trolley lines and to build new trolley lines on a number of streets where there were no transportation facilities. The City Railway's first experience with electricity was on Sixty-first and Sixty-third streets during the World's Fair, and the experience was so remarkably satisfactory that it was immediately decided that the cable and the electric motor should in the future be the only



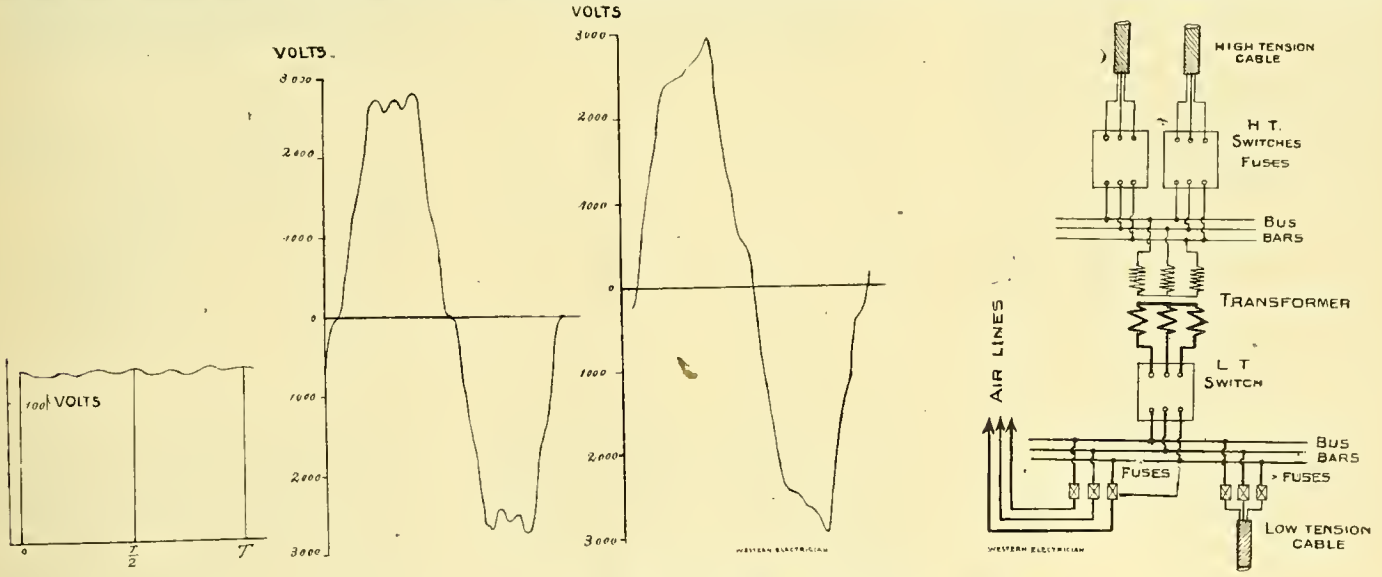
FIGS. 3 AND 4. A CENTRAL STATION WITH THREE-PHASED CURRENT GENERATORS.

power used. The work of converting the horse car lines was started in earnest last fall and has been going on all this year as rapidly as it could be pushed. The company is today operating 80.6 miles of electric road. Within the next few weeks over 20 miles more of electric lines will be started, and when the present plans for the system are fully carried out, 125 miles will be operated by electricity.

It makes an interesting study of electric lines to follow in detail the traffic on those lines which the City Railway has already equipped with electricity. Such a statement shows, for instance, an astonishing increase on the 11.6 miles of the Auburn Park line, running from Thirty-ninth and State streets by the way of Wentworth and Vincennes avenues to Seventy-ninth and Halsted streets. That road was operated by horse cars until a few months ago. When the trolley cars were put on the running time from the Seventy-ninth street terminal to Thirty-ninth street was shortened 44 minutes. The record for last month shows that the traffic of that line increased 118.37 per cent., as compared with the traffic in May, 1894.

The appended table gives in detail all the lines of the Chicago City railway now equipped with electricity and shows the mileage, the saving of time per trip as compared with the horse car time schedule, and a comparative record of earnings for the month of May, showing the increase as compared with May, 1894:

While some lines, like the Auburn Park and the Sixty-ninth street lines, show a great increase as compared with the traffic a year ago, it will be noted the average increase for all lines equipped with electricity has not been nearly so remarkable as is generally imagined. The average increase in the traffic of the 80 miles upon which the trolley cars are now running has been 20.23 per cent. The Stock Exchange speculators who have been building rosy estimates of the traffic of the street railway companies after the trolley cars have entirely superseded the horses should note these figures with a good deal of care. The bulls on street railway stocks have dropped into an easy habit of figuring that the replacing of horses with electric motors means a doubling of traffic and a cutting in two of operatiog expenses. Statistics have been shown of certain North Side lines where the increase was quite as pheoomenal as on the Auburn Park line of the City Railway. When the fact is kept in mind, however, that in spite of an increase of 118 per cent. on the longest line the City Railway has equipped with electricity the average increase for the whole electric system is a little over 20 per cent., it will be easy to see that one is pretty apt to fall into an error in estimating street car earnings after this easy



FIGS. 5, 6, 7 AND 9. A CENTRAL STATION WITH THREE-PHASED CURRENT GENERATORS.

1. Abstract from the *Sunday Tribune*, Chicago, June 23, 1895.

rule of a doubling in traffic and a cutting in two of expenses.

| | Miles of single track. | Percentage of change in earnings. | Saving in minutes per trip. |
|---|---|---|---|
| Sixty-first street, from Cottage Grove avenue to South Park court (electric in 1894) | 1.74 | 23.77[1] | 8 |
| Sixty-first and Sixty-third streets, from Ashland avenue to Stony Island avenue (electric in 1894) | 9.30 | 8 53 | 32 |
| Thirty-ninth street and Union Stock Yards from Cottage Grove avenue, via Thirty ninth, Wallace and Root streets (horse in 1894) | 4 81 | 16 00 | 18 |
| Forty-third street and Union Stock Yards, from I. C. R. R tracks via Forty-third, State and Root streets (horse in 1894) | 5.50 | 31 26 | 20 |
| orty-seventh street, from Cottage Grove avenue to Western avenue (electric in 1894) | 8.00 | 7.05 | 24 |
| Auburn Park line, from Thirty-ninth and State streets via Thirty-ninth street, Wentworth and Vincennes avenues, and Seventy-ninth street to Halsted street (horse in 1894) | 11.60 | 118 37 | 44 |
| Sixty-ninth street, from Sixty-fourth and State streets, via State street, Vincennes avenue and Sixty-ninth street to Leavitt street (horse in 1894) | 6.92 | 57.87 | 28 |
| Halsted and Sixty-ninth streets, from Sixty-ninth street, via Halsted street to Union Stock Yards (horse in 1894) | 7 12 | 36.83 | 24 |
| Halsted and Fortieth streets, from river via Halsted to Union Stock Yards (horse in 1894) | 3.31 | 15 00 | 10 |
| Thirty-first street, from Lake Park avenue via Thirty-first street and Pitney court to Archer avenue (horse in 1894) | 5.45 | 15 72 | 24 |
| Twenty-sixth street, from Cottage Grove avenue to Halsted street (horse in 1894), blocked 1895 by elevation L. S. and R. I. tracks | 3.01 | 18 67[1] | 10 |
| Thirty-fifth street, from State street to California avenue (electric in 1894) | 7.00 | 1 00[1] | 26 |
| Wallace street from Thirty-ninth street, via Wallace, Twenty-sixth, Twenty-ninth and Hanover and Butler streets to Archer avenue (horse in 1894), ran to Lake street via cable in 1894 | 6.85 | 28.50[1] | 16 |
| Total | 80 61 | 20.23[2] | |

1. Decrease.
2. Average increase.

The table which has already been given shows the electric system of the City Railway as it is in operation to-day. In addition to that there are now in process of construction four lines aggregating a little over 20 miles upon which the trolley cars will be running in a short time. There has been some delay in receiving rails, but that delay will not much longer hold back the improvement. Those lines upon which construction is now partially completed are as follows:

| | Miles of single track. |
|---|---|
| Ashland avenue, from Archer avenue (river) at Thirty-first street south on Ashland avenue to Sixty-ninth street | 0.50 |
| Archer avenue, from (Chicago river) Pitney court west on Archer avenue to Thirty-eighth street, thence west on Thirty-eighth street to Kedzie avenue | 5 00 |
| Wentworth avenue, from Archer avenue south on Wentworth avenue to Eighty-ninth street | 4.19 |
| South Chicago avenue, from Seventy-first street and Cottage Grove avenue, via South Chicago avenue, south-easterly to Seventy-fifth street, Grand Crossing | 1 50 |
| Total | 20.19 |

The following lines were covered in the blanket ordinance granted by the council July 16, 1894, and will soon be built, but construction on them has not yet commenced:

| | Miles of single track. |
|---|---|
| Halsted street and Seventy-ninth street, from southern terminus of present track, Sixty-ninth and Halsted streets, south on Halsted street to Seventy-ninth street | 2 50 |
| Center avenue, from Forty-seventh street, south on Center avenue to Sixty third street | 4.00 |

The plans for electric construction which the City railway has matured are not entirely comprehended in the ordinance already obtained. The company has plans covering about 24 miles of line, for which ordinances will probably be asked for. Work has been actively going on for some weeks securing the consent of property-owners and there have been a good many difficulties to overcome. But in most cases the consent of a sufficient number of property-owners has been obtained. On Indiana avenue there has been a hard task to convince the residents that trolley cars were better than horse cars. Some amusing instances of objections that have been met with are recounted by the people who have been canvassing for property-owners' consents. In one house the head of the family refused to sign on the ground that he was absolutely opposed to having the quiet of Indiana avenue invaded by thundering electric cars. His next-door neighbor refused to sign because he would not have any noiseless trolley cars sweeping down on him before he knew what was coming.

The following table shows the lines for which ordinances will now be asked:

| | Miles |
|---|---|
| Kedzie avenue, from Thirty-eighth to Sixty-third street | 6 5 |
| Archer avenue, from Thirty-eighth street to Fifty-first street | 5 2 |
| Western avenue, from Archer avenue to Seventy-first street | 4 2 |
| Fifty-ninth street, from State street to Ashland avenue | 4 |
| Indiana avenue line, from Wabash avenue at Eighteenth street, east on Eighteenth street to Indiana avenue, thence south to Thirty-ninth street | 5 06 |
| South Park line, from Thirty-ninth street south on Indiana avenue to Fifty-first street, thence east and west on Fifty-first street, thence to Grand boulevard and State street | 4 |
| | 23.76 |

The first four lines are to be built on streets that have no transportation facilities at present. On Indiana avenue and on the South Park line horse cars are to be replaced with the trolley.

The City Railway is also at work obtaining the consent of property-owners on Clark street for bringing the trolley as far north as Washington street. In the event it is successful in that plan all the electric cars west of State street will be brought directly down-town over Wentworth avenue and Clark street without necessitating transfers to the cable.

The map which accompanies this article shows the system of the City railway as it stands to-day, together with the contemplated extensions. A passenger boarding a car of the company at Sixty-ninth and Leavitt streets and riding down-town gets a ride of about 11½ miles for 5 cents. That point is the most distant from the down-town terminal, but there are a number of rides that can be taken on the lines of the company in the neighborhood of 10 miles in length. South of the City Railway lines is a perfect network of electric roads, covering not alone the southern part of Cook county away south as far as One Hundred and Thirty-eighth street, but running clear over into Indiana. These are owned by four distinct companies and all form important feeders to the City railway system, although there is no direct or indirect corporate connection between them and no special transfer arrangements.

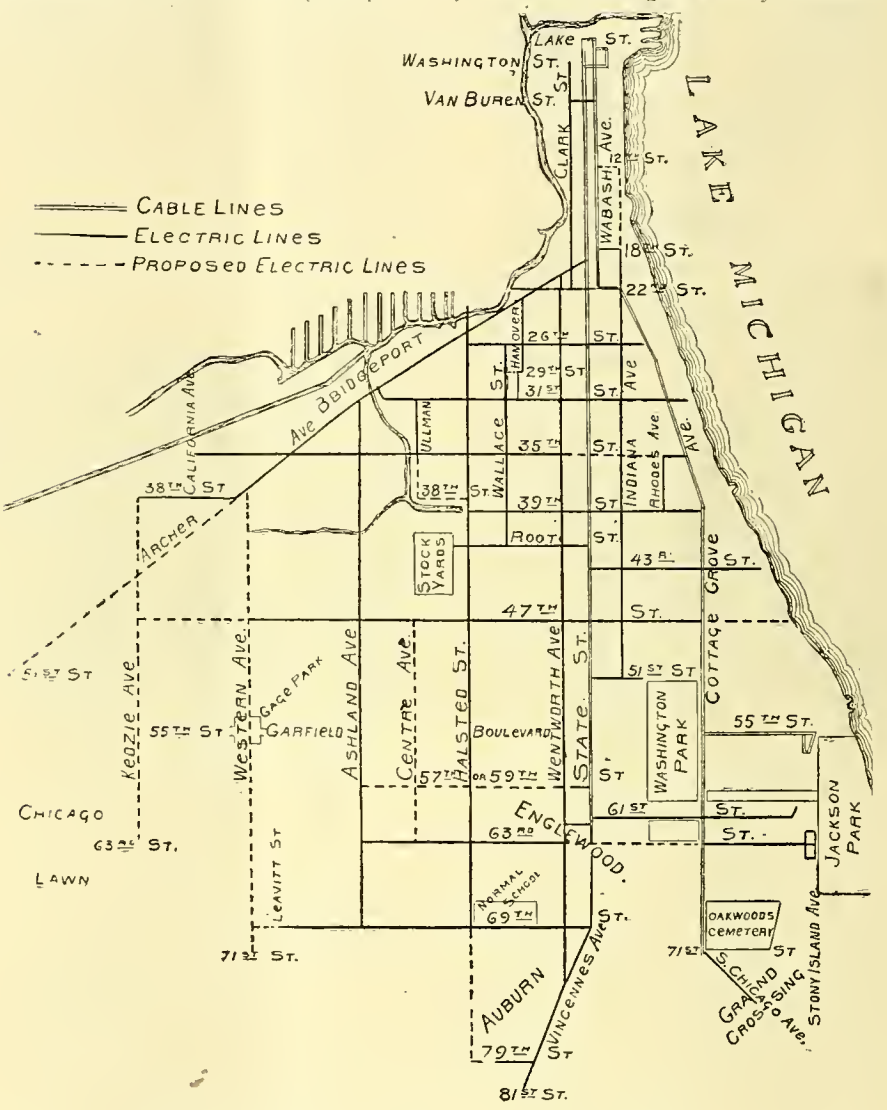
"The distance in time between the business center and the residence district is one of the important elements in fixing the value of property," says M. K. Bowen, superintendent of the City Railway company. "The value of such property is influenced but little by the number of miles it lies from the business center. Its value depends upon its availability, and time is the important element. The building of electric lines will in a large measure revolutionize values in many districts, I should think. Rapid growth and development is certain to follow the lines of rapid transit to the business center. The rapid multiplication of these lines in the last few months has added a vast amount to the value of residence property through the district which the lines of this company cover.

"Electricity is a complete success as a motive power for surface roads under certain conditions. There is no probability that the cable will ever be replaced with electric cars, at least so long as the electric system is anything like it is at present. When there is sufficient traffic to justify twelve cars to the mile of double track the cable becomes the cheapest form of traction per car mile run, and electricity cannot compete with it. On the other hand, when the traffic is not sufficient to justify more than four cars to the mile of double track, horses become the cheapest form of motive power. With traffic anywhere between these two extremes electricity is the most desirable. The space in a barn taken up by a street car is 300 square feet. The space occupied by horses to run that car is 800 square feet. The change to electricity gives the railroads two-thirds more barn room. The limit of the capacity of cable lines is reached when a rear train is compelled to stop for a train in front of it, when the first train stops to take on or let off passengers. We came just about up to that limit in 1893, when we ran trains with fifty seconds headway. With Clark street equipped electrically, taking care of the traffic of the cross-town lines, the congestion on the cable roads will be greatly relieved and there will be no danger of reaching the limit of their capacity for some years to come.

"We shall have about 240 motor cars in operation within forty days. We hope to run the cars from Seventy-ninth and Halsted streets down Seventy-ninth, Vincennes, Wentworth and Clark streets to Washington street. We also expect to run a through line to the down-town business center by the way of Root, Wallace, Twenty-ninth, Hanover, Archer and Clark streets to Washington street. This will be the first through line to the business center that the Union Stock Yards have ever had."

The electric system of the City Railway company, as illustrated at its power house on Wabash avenue, between Fifty-second and Fifty-third streets, shows many points of variance with the system being installed by the North and West Chicago Street Railway companies. There will be but a single power house, and it is declared it is large enough not only to answer all the present needs of the company, but to take care of all the development for at least the next 10 years. The construction of this power house is less elaborate and undoubtedly much less expensive than some of the power houses built by the Yerkes syndicate. But Chief Engineer Robert J. Hill declares he is ready to stake his reputation on the ability of the plant to turn out electricity cheaper than any other power house in the country. The idea of directly connected dynamos has not yet been adopted. The dynamos that are being put in by the North Chicago and West Chicago companies have an armature on the same shaft as the fly-wheel of the engine and there are no belts. The City Railway engineers have decided against that form and used dynamos driven by rope belts. The ropes are made of cotton, 1¼ inches in diameter and 3,800 feet long, manufactured with a single splice. They are driven at a rate that makes the rope travel 6,000 feet a minute.

The company is burning coal screenings that cost $1.40 a ton, and by means of automatic stokers is able to get as much efficiency from that coal, it claims, as other people get from coal at $2.25 a ton, and it does that without anything but a fleecy cloud of white vapor coming from the tall chimney. Smoke prevention, rather than smoke consumption, is what the men who have built this plant believe in, and by perfect combustion they prevent any smoke being made. In this power house are 10 single expansion engines with 18 foot fly-wheels, weighing 30 tons each, and running 100 revolutions a minute. Each pair is connected to a single crank shaft and develops 1,500 horse power. The dynamos are capable of operating 50 motor cars. The plant has a capacity, therefore, of 500 cars, although at present only about 160 are in operation. The almost perfect automatic character of the plant is remarkable. There were but two men in the big engine-room, and it is as



ELECTRIC RAILWAY LINES OF THE CHICAGO CITY RAILWAY COMPANY.

clean and well kept as if it were put up for exhibition only. Practically everything about the plant is automatic, from the automatic coal stokers down.

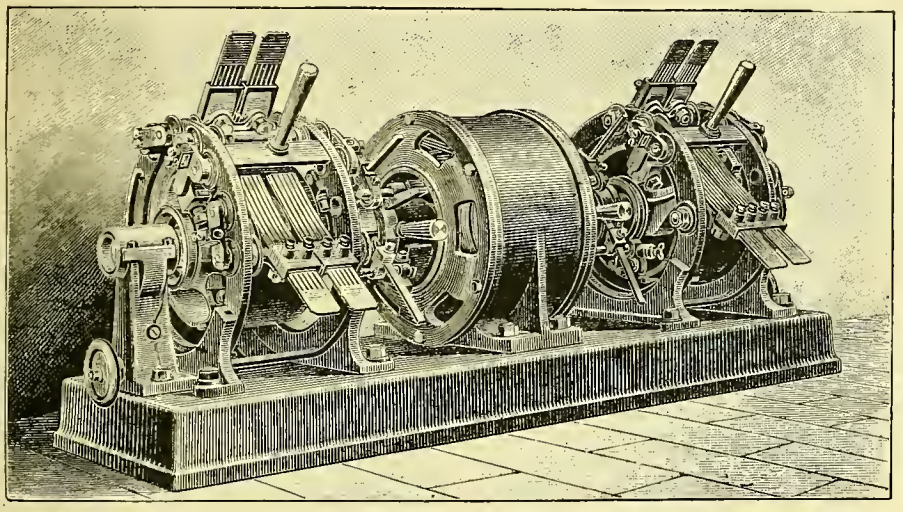
In one direction the City Railway has developed a system which is a little in advance of anything other companies have done. It is in the direction of preventing accidents in case of fire. The whole system is divided into 20 sections. Whenever there is a fire alarm it is sounded at the barns and power station at the same instant it is in the fire department stations. When the alarm sounds the man at the power house switchboard instantly turns off the current along the particular section of the road where the fire is located. A wrecking wagon, to which a team stands always harnessed, starts for the scene of the fire and usually before the fire department arrives, if the blaze is at all serious, the crew has taken down the trolley wire and given free rein for the fire department's operations.

This wrecking wagon is a remarkably complete institution. It has a telescope platform which can be quickly wound up so the men working on it are on a level with the trolley and they can take out a section of the trolley wire in a very few minutes after the fire alarm has sounded.

For the first four months of this year the traffic of the City Railway company was 25,428,421, against 25,056,683 for the first four months of 1894. That traffic in each of the two years was divided between cable, electric, and horse car lines as follows:

| | 1895. Per cent. | 1894. Per cent. |
|---|---|---|
| Cable | 61.62 | 64 36 |
| Horse | 10.68 | 26.84 |
| Electric | 27.70 | 8.80 |

The City Railway claims to be the most liberal in its systems of transfers as now in operation of any street railway company in the country. Fully 4,000,000 transfers are issued every month. On all north and south lines, including Archer avenue, transfers are issued to all connecting lines on the payment of cash or for a transfer from another line.



ALTERNATE-CONTINUOUS CURRENT MUNICIPAL PLANT.

On all east and west lines transfers are issued to any connecting lines on the payment of a cash fare.

## Electric Alarm Lock.

An electric alarm lock which has many excellent features is shown in the accompanying cut. The system of which it is a part comprises the lock *F*, the catch *G* and a plate *U*, which carries the electrical contacts. The lock has three bolts, *D*, *B* and *A*, this last called the half-turn, which only serves as a latch when the door is closed. The catch *G* which faces the lock has two blocks *V*, *V*. All the contacts are made through the plate *U*, which is fixed by four screws upon the door frame so that the catch is insulated perfectly from it. An insulated block *P* has fastened to it a long spring, the extremities of this spring being finished with ebonite buttons, resting on the plates *V*, *V*. In this, the normal condition, the two buttons insulate the spring from touching the plate *U*, yet if any metallic tool is inserted to pry open the lock, contact is formed and the alarm bell will ring. The bolts *A* and *B* are electrically separated from the rest of the lock by the pieces *C* and *Z*. When the key is turned in the lock the bolts entering the catch make contact with two springs, *S* and *R*, fixed on the plate *U*. Two pieces, *I* and *L*, are also insulated from the lock frame, but are connected with the bolts by the spring *M*, while the lock frame is connected to one pole of the line, the springs *S* and *R* being in contact with the other pole. When a skeleton key, a hook, or wire is placed in the keyhole, contact with *I* or *L* closes the circuit, and warns the inmates, but the proper key, fitted to pass these contact points, will throw the bolts without sounding the alarm.

Another peculiarity of this lock, which makes it especially valuable for stores or offices, enables the proprietor to notify the porter when he leaves the premises, and also when he returns. This is a function of the bolt *D*. When the door is being locked this bolt makes an instantaneous contact with two small springs *K*, permanent contact being prevented by the insulation *E* on the bolt. Connected with these two terminals is a battery which moves a disk carrying alternately upon its face the words "out" and "in." This bolt *D* can only be operated from the exterior, but the rest of the combination may be manipulated from within, without sending an alarm.

## Alternate-continuous Current Municipal Plant.

There is nothing which is more annoying in the way of artificial illumination than the quality of vacillation. If the light is too brilliant it may be subdued; if it is dim we may still accommodate the eye to its use, but the constant changes of a flickering lamp require such intense alternate action of the optic nerve that great fatigue results, and if too long continued trouble follows, which may become serious.

Helmholtz experimented along this line and established the fact that a source of light kindled and extinguished about 25 times per second was fatiguing to the eye; and Prof. Forbes has made investigations with an incandescent lamp of 16 candle power and 50 volts which show that when the alternations were less than 25 per second it proved tiresome to the eye and this fatigue continued to be felt up to 28 periods. Arc lamps are unstable with similar alternations, but when the periods reached 50 per second the annoyance is no longer appreciable. For this reason the transformation of alternate into direct currents must attract much attention, and its successful accomplishment be a matter of interest to all.

M. Pellissier, in *La Nature*, furnishes some information which is noteworthy, relative to the Cardiff, Wales, municipal plant.

The authorities, having decided upon the installation of a plant for both public and private service, were obliged on account of high prices and poor facilities to select a site at some distance from the center of the place. A spot was found at Canton, a suburban village, which lay along a coal railroad, and was of very little value for any other purpose. But the distance was such as to preclude the use of any other than an alternating system, with a pressure of 2,500 volts.

The dynamos are consequently simple alternate current machines of the Siemens type, remarkable for their dimensions, furnishing 75 amperes of current at 2,500 volts, with 40 periods per second. The armatures, of the disk form, are movable, and of about five meters diameter. The exciters—continuous current—are coupled directly upon an extension of the alternator shafts, these latter being coupled directly to the engine in a manner which makes each a complete and independent system. There are also two small alternators which have each a capacity of 16 amperes at 2,500 volts.

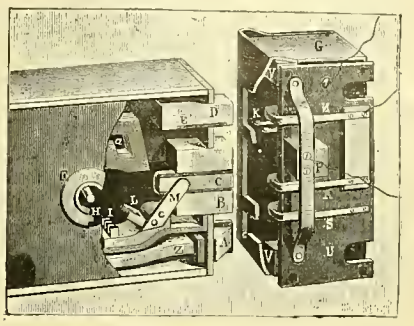
Subterranean cables convey the current to the center of the city, where the tension is reduced to 105 volts.

The incandescent lighting is done by the alternating current, but through fear that the low frequency of the periods would produce a flickering light, the city engineer, Mr. Massey, decided to change the alternating into a direct current before using it for street illumination.

The illustration shows a type of the Ferranti transformer which changes the current. It consists of a small synchronous motor, the movements of which are dependent upon the periods of the current, and carries two commutators. The machines are placed in the basement of the city building, about two kilometers from the central station. Two of these are in service, the third being held as a reserve. Each of them has a capacity of 24 lamps of 12 amperes in two circuits of 12 lamps in series.

The small synchronous monophase motor has a commutator for changing the current necessary for feeding the inductors. A high tension commutator is placed at each extremity of the shaft, and each of these supplies current to one circuit.

A reversing switch and a cut-out are placed in each circuit,



ELECTRIC ALARM LOCK.

and a water regulator is let into the primary circuit, which serves to break the sudden vacillation, in case of cutting out a group of 12 arcs at the same instant on the circuit of a small machine.

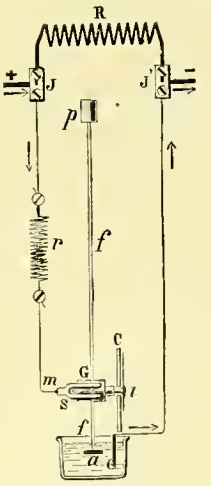
The arc lamps are of the Siemens type, and are placed at 6.75 meters above the street. The lamp-posts are cast-iron; a design at the base, on a door which can be opened to give access to the wires and cut-outs, represents the arms of the city. These posts are placed at the pavement line in the narrow streets and upon the "refuges"—miniature parks in the center of the wider streets—where the width permits.

## Continuous Current Meter.

Among the meters now finding favor in Europe, that illustrated in the accompanying cut is conspicuous. It is composed of a silver wire *f*, resting at its lower extremity upon a glass plate *a*, and carrying at its upper extremity a weight *p* bearing down perpendicularly. The vessel surrounding *a* contains a solution of azotate of silver.

The current to be measured enters at *J* and leaves at *J'*. Two resistances *R* of very coarse wire and *r* of fine wire are placed in parallel upon the route through the instrument. The small proportionate amount passing through the latter coil at *m* reaches a spring *s* which rests against the wire *f*, and passes thence into the solution at *a*, and out in the direction of the arrows, by way of the electrode *c*.

As the electrolytic action cuts away the wire *f* the weight *p* forces it downward, communicating a rotary motion at *G* to a shaft to which the needle *i* is attached before the face of



CONTINUOUS CURRENT METER.

the graduated scale, and from which the ampere hours are read direct.

## Temptation Would Be Too Great.

[From the *Chicago Evening Post.*]

Professor Barrett's remarks about the use of the city's electric lighting plant to furnish light to private consumers are worth considering. * * * * * * The objection would be that the conditions of American politics would preclude the possibility of honest and profitable management. Look at the men who collect the taxes (or don't collect them), who directed the water supply system, and who controlled the streets. How long would it be before these gentry, by means of bogus contracts and stuffed pay rolls, would wipe out the difference between the cost of production and the revenue from sales, which corresponds to the interest on bonds and dividends on stock paid by the electric light and gas companies?

THE Bell telephone company has taken the necessary legal steps to secure possession of the remainder of the earth.—*Chicago Tribune.*

If Justice Putnam writes the opinion in this case, he will endeavor to establish the fact that an apology is due the Bell company for having kept it out of possession for so many years.

IF, instead of accepting without reserve all of the glowing statements sent out in the form of interviews with the city electrician, the Chicago daily papers would investigate the subject under discussion, they would find that Superintendent Barrett may be mistaken, if indeed he does not intentionally impose on the credulity of the public. For instance, while municipal lighting is under consideration it would be well for the city papers to secure the opinions of competent electrical engineers or managers of central stations on this subject, and compare them with those in the published interview of last week. It is not necessary to go to representatives of interested companies, although as much weight should be given the statements of these concerns as that of Superintendant Barrett—both being interested in the outcome—and surely their experience and knowledge of the business would make their opinions of greater value than his. But let all these considerations be put aside and the matter left for determination to consulting and constructing engineers and central station managers of experience and ability. This, certainly, is a fair proposition.

THE plan advocated by Governor Altgeld for the enactment of legislation providing for the establishment of boards of arbitration in this state has been tried elsewhere, but has never been favorably received any more than has the expensive and inefficient system now in vogue in New York state. This latter is a costly experiment and should serve as a warning to other states. It has cost the state from $14,000 to $22,000 a year to maintain it, and it is neither feared nor respected—in fact the commissioners have about as much power as a trio of meddlesome old women, and their "recommendations" receive just about as much attention as if they were the result of the deliberations of an old ladies' sewing circle. The people of this state desire no such ornament. There are plenty of boards and commissions at present, and until a new and far more effective plan is advanced than those already proposed, neither the capitalists nor workmen of Illinois favor the establishment of boards of arbitration, mediation or conciliation.

IT is only during the hot weather that all the features of the Welsbach burners are fully appreciated. Those who are using them now realize that the claims that are made in their behalf for economy and efficiency in illumination are of only secondary importance. It is in heating capacity that these miniature furnaces are preëminent. It will be remembered that we have repeatedly called attention to this characteristic and insisted that the popularity of the new burner would be short lived. The following paragraph from an article on "Gas as an Illuminant," by Foree Bain, in the WESTERN ELECTRICIAN, December 15, 1894, is timely:

> And now we have another winter scheme in the revival of the Welsbach burner. It is a matter of note that the attempt to introduce this lamp again has been made in the fall of the year, at a time when heat is very desirable and when the great amount of heat given out by these burners may be turned to some useful account; but in the summer-time, when the scorching days have come and when the nights are no improvement on the days, and when the gentle breeze is conspicuous by its absence, how many Welsbachs will we see? 'Tis then the ash barrels will groan with their burden of discarded Welsbachs.

Those who tried the Welsbach burner during the winter months know that Mr. Bain was thoroughly familiar with the qualities and faults of this device. If economy were, the only requisite, this "incandescent gas lamp," as its advocates call it, might compete with the electric light, but those who have used the latter will never be satisfied with the Welsbach.

COLLEGE publications issued by students are always interesting, but at no other period are they so attractive as at this time of the year. In their pages are reflected the thoughts, the plans and hopes of aspirants for honors in the busy commercial world which they are about to enter. Their ideals are high, and if they but follow them they will undoubtedly gain honor and distinction, if, indeed, they fail to achieve fame and fortune. They have sufficient incentive furnished in the excellent example of those whose successes are frequently chronicled in the periodicals which are published by their alma mater. These pages contain ample evidence to prove that the days passed in the class room and in the laboratory give the possessors of this experience great advantage over those who have been less fortunate. In a journal published by the students of a leading college of engineering there is an excellent department in which brief mention is made of the present location, occupation and standing of former pupils. In glancing over this list from month to month the most casual perusal cannot fail to impress upon the reader the importance of college training to young men who intend to enter commercial as well as professional life. One cannot look through these columns without meeting many names already familiar through some achievement in science or art, prominence in the professions or success in commercial life. Of course, there are comparatively few who gain world-wide fame or national renown, but of those who attain a competence college men comprise a large proportion. The lesson which this experience should illustrate is the advantage of entering the struggle of life thoroughly equipped, and in these days of competition the advantages of college training cannot be too highly valued.

"OUR neighboring city of Chicago is a most striking example" of the fact that municipal lighting is not profitable. This is the conclusion a Milwaukee official reached after carefully examining the reports made by cities which have had experience in this line, and it confirms the opinion freely expressed by competent electrical men who have given the matter careful consideration, but it may be news to the people of Chicago. Depending upon the published statements of interested or irresponsible persons, taxpayers have come to believe that the city was pursuing an economical policy in establishing a plant for electric street lighting. It is not at all difficult to understand how this impression was gained, although it is quite remarkable that the public should so long remain in ignorance of the true condition of affairs. It can only be explained by the fact that there was implicit confidence in the ability of Supt. Barrett to fulfill the promises he made which induced the city to adopt the policy of lighting its streets, and that he has thus far evaded making a complete statement of the result of this experiment. Such a statement would show that instead of fulfilling the promises made for it and thereby effecting an actual saving for the taxpayers, the present municipal lighting system of Chicago has been a very expensive and unsatisfactory experiment. Supt. Barrett has been given ample opportunity to carry out his agreement to provide an economical lighting system for the city streets, but he has failed to show any advantage gained for the taxpayers. He has been urged repeatedly to present data in support of his claims that he was furnishing light at a price named by himself as the actual cost of production, but he has never been able to prove his case. In fact the whole subject of the cost of this project to the city has been shrouded in mystery, and thus far it has been utterly impossible to secure from the city electrical department any detailed statement that would be at all reliable. But while it is true that Supt. Barrett has positively refused to enlighten the electrical fraternity upon the cost to the taxpayers of his favorite scheme, and has encouraged the belief that the project was a profitable one for the city, electrical experts of established reputation have made it their business to investigate the subject thoroughly and they have proved conclusively that Supt. Barrett's statements are based upon figures that are not complete and that they are therefore neither fair nor honest, but misleading and injurious to the electrical business. Supt. Barrett cannot plead ignorance of these facts, for he has been confronted with them and he has been urged to disprove the charges of bad faith made against him or to admit the error of his statements. He has done neither, but he has repeatedly promised, or rather threatened, to publish figures that would convince the world of the truthfulness and the justice of his claims and cover his critics with confusion. For six years the fraternity has waited, occasionally reminding him of these promises, but he has ignored all demands.

Now, however, a new scheme is presented to the city by which it is proposed to keep up the present delusion. The city is urged to engage in commercial lighting, and in published interviews the city electrician tells the people of Chicago the great advantages to be derived from giving him additional power. The "arguments" used six years ago in advocating the establishment of street lighting plants are again presented in support of an extension of the system so as to enable the city to compete with established companies and drive them out of the field. Irrespective of the rights of these corporations, there is a question of accounting to the people of Chicago which Supt. Barrett should be required to meet before further power be given him. He must show he has not abused the confidence already reposed in him; that he has not deluded the taxpayers by promises which he had not the ability to keep; that the proposed scheme has some merit, and that it is not intended solely to cover up the failure of the last project engineered by him. The statements made in the interview given out last week to the newspapers of Chicago indicate that the same methods will be adopted in booming this scheme that were used so effectively six years ago. The people are told that there will be no dividends and no interest to pay, as in the case of a private concern. Of course Supt. Barrett knows that the city would have to pay interest upon the money it would have to borrow to establish this plant, but this is only one of the reckless statements and is in keeping with many others that have been made in connection with this enterprise and the one that preceded it. Yet this assertion is a fair illustration of the "arguments" advanced in support of this project. Concerning the cost of labor, it may be said that recent experience has led the people to consider every scheme of this character in the light of a political measure and that the pay rolls of the city are already large enough.

In considering the question it should be remembered, too, that the private interests involved are of great magnitude. To jeopard them would be a great mistake and bad public policy. Supt. Barrett need not be surprised if, in resenting his unwarranted interference, the interested electrical companies should call him sharply to account. It cannot be said that they have not heretofore treated him considerately. The electrical fraternity of Chicago and of the country is under no obligation to John P. Barrett. Even his most ardent admirers will not question the statement that he has been honored and rewarded to the full extent of his ability and services.

## Popular Errors About Electricity.

By C. C. Haskins.

There is a large amount of brilliant ignorance abroad in the land as to the capabilities for good and evil of electricity, which leads people into serious, if not harmful, conclusions.

The trouble arises largely through a lack of distinction between "current" and "tension," terms which, to the public ears, are more readily comprehended if, in their stead, one should say mass or quantity and pressure or strain.

Where a larger amount of electric current passes in a given time this flow is said to be one of more amperes, as one would say a larger pipe would discharge a greater number of gallons of water per minute, while a smaller sized pipe, as at the nozzle of a fire engine hose, might throw a stream of water very much farther by virtue of a much heavier strain or push behind it. One of these streams might thus furnish a great quantity at the delivery, and the other a comparatively small quantity at a very much greater distance away.

Now, one of these may be compared to a commercial current of electricity which is used by the electrotypers and platers. The flow of current is large but the pressure is minimum. There is next to no necessity for careful insulation, for such a current has little tendency to escape; there is not that form of energy in its make-up. It is not potent for harm in the way of shocks; men handle it with perfect impunity. The surroundings of the electroplater's bath are wet; the men are wet, and their wet feet are in constant contact with the wet floor. The solution in which the plating is going on is a far better conductor of electricity than ordinary water, yet the attendants are constantly handling the metal articles, removing and replacing them without the slightest inconvenience. Here is a current of electricity capable of dissolving a metal which would withstand some thousands of degrees of heat in a furnace, carrying that metal in solution to the opposite pole of the bath and re-depositing it in a metallic form on the article to be plated, yet a current which has not the element of push or pressure energy sufficient to propel a spark through the air across a space of one thirty-second of an inch—probably not one-half that. It is known to the electrical craft as a current of extremely low tension, a current of high quantity or high current flow. It is an extreme manifestation of one of the characteristics of an electrical current.

There is, on the other hand, a form of current which has a diametrically opposite character to this. It is possible to have a current of so much push or pressure that it is next to impossible to restrain it or keep it from escaping, even through the atmosphere. The flow from a frictional electric machine is of that character. The spark from one of these generators may be sent through the air (and air is one of the very best insulators known) two or three feet; it can be made to bore a hole through a plate of glass, and yet, although it may be discharged into a dish of gunpowder and blow the grains away, it is not at all certain that it will set them on fire. The spark which so many persons first saw developed last winter during the extreme cold weather by sliding across the carpet, and touching the gas pipe, is another example. The air in winter is far drier than in summer. Moisture makes the air a conductor, better in proportion to the amount of water it contains, and a small amount of moisture in the air is sufficient to prevent an accumulation of this high potential electricity. We cannot get these spark demonstrations in the summer season because of the moisture in the atmosphere, which serves as a vehicle for its escape.

Now for commercial use we have currents combining these two characteristics in different proportions. For telegraphic purposes, a certain amount of pressure is required, sufficient to push a small amount of current a long distance, but this pressure is not sufficient to permit it to dissipate itself in the surrounding air, except to a limited extent, save in a very misty rain. The lines are insulated at every post, and the limbs of trees are cut away to prevent escaping current. There is only a very limited amount of current flowing, and while a considerable shock may be obtained from a telegraph current, there is little if any danger to life or property by contact with it.

A still lower level in the scale of risks is the current used by the telephone companies.

Ascending in the scale, we come to the low potential current used for lighting and power purposes. The pressure here is no heavier than on short lines of telegraph, the same virtually as with an ordinary blue vitriol or gravity battery of 50 to 110 jars. The difference between it and the telegraph current is in the characteristic of quantity, or current flow. It remains constant in pressure—usually 50 to 110 volts—but in proportion as openings for the flow are made, that is, as lamps are turned on or motors are brought into service, the increased demand is met by a greater supply, and the quantity is thus varied, while the push, the voltage, remains stationary. This pressure is not necessarily a dangerous one to life, and is not sufficient to force the current through more than a mere fraction of an inch of atmosphere. It produces an unpleasant sensation when received through the person, and is not safe to handle in a district where other and more powerful currents may be accidentally crossed with it. If a contact of good conductivity is made with the wire carrying this current, heat results, and without the safeguard known as the fusible metal, which acts on much the same principle as the soft plug in a boiler, and opens the circuit, the danger from electric lighting would drive it out of existence.

The next grade in the upward scale of voltage is that generated for street railway service—about 500 volts—which also remains constant in pressure, but varies in the output, according to the demand. This pressure, too, is incapable of jumping through a very short, dry air space, but it is a dangerous current to encounter.

Above this last in the scale comes the ordinary high-tension arc system. This differs materially from the systems in which the quantity is variable but the pressure is constant. Here the quantity, or flow, is always the same, but the pressure varies, increasing with each additional lamp. These lamps require a pressure of from 45 to 50 volts each, but they do not vary the flow. Now, with ten lamps only in the line there would be 450 to 500 volts of pressure, and with 50 lamps there would be 2,250 to 2,500 volts, and even then the pressure is only a small fraction of what it is in the spark generated by sliding on the carpet, or the spark from the friction machine. But it has the other characteristic not possessed by these carpet-generated sparks. There is sufficient quantity or flow of current to make such a current extremely dangerous. It is the combination, if it may be so called, of high and low powers; that is, the possession of the two characteristics—volts and amperes—that makes this dangerous. It will kill, but it cannot jump an air space. It has pressure enough to require high insulation to restrain it, but the insulating properties of the atmosphere (which, when ordinarily dry, are far in excess of those of either glass, porcelain or india rubber) are proof, where this medium is as thin as an eighth of an inch, against the jumping of an electric light current, by virtue of its initial pressure.

## Telephone Inquiry in England.

[From the *London Electrician.*]

When a government is in want of a policy, or a minister in want of a cue, it is usually sought for inside one of the parliamentary committee rooms. The device is not generally esteemed very dignified, and is often only a roundabout way of shelving the subject altogether. None of these things, however, can be said of the parliamentary inquiry which has just completed its examination of witnesses in respect of the telephone service and its relations with the state. The report may take probably a considerable time to prepare, if the voluminous evidence is to be impartially weighed and digested; or it may be got ready very quickly if, as might happen, the committee are unable to offer any definite recommendation except for the publication in full of all the evidence tendered. On the whole, we are in that position ourselves, and we make no apology for offering some comments at this stage of the case, feeling sure that nothing we can say one way or the other will affect the broad conclusions to be drawn from the numberless suggestions and inexhaustible statistics placed at the committee's disposal.

One of these conclusions certainly is that the public will learn to set a more correct estimate on the value of opinions proffered by self-chosen advocates of particular and novel schemes of telephonic administration. For knocking the bottom out of irrepressible faddists there is nothing so sure as a public inquiry; and it must be said of this one, to its credit, that not a few personages who thought themselves authorities have left the committee room emptied of their reputation, if not of their conceit. It is very easy to collect any number of complaints against the telephone system—or, for that matter, against any human system whatsoever; but when men come forward with schemes of reform they should at least take the trouble to understand something of what they are talking about. Representatives of municipalities, who are greatly to the fore just now, are very much lacking in this respect; and the National Telephone company's contention that its business would be worked less efficiently by municipal bodies than by private enterprise found no little support in the character of the testimony offered by typical members of the former. Not excepting the "evidence" tendered by that superfine organization, the London County Council, the municipal witnesses were, we must admit, far from showing any special capacity for working the telephone. In point of fact, the major part of the witnesses failed to grasp the true problem to be solved, namely, how to convert an imperfect telephone system into one corresponding with that of the perfected telegraph system which exists in government hands. None but the official witnesses fully realized this point—the only one indeed worth considering. What the telephone has suffered from hitherto has been, it may be confidently asserted, a species of parochialism, gradually, it is true, developing on a bolder and more national basis, but still hampered and afflicted by the petty and narrow limitations under which its early years were spent. Nobody is particularly answerable for this; railways grew up in a similar way. Telephones were for a good while supposed to be merely elongated speaking tubes, serviceable for purely local purposes. The plans, therefore, were localized; and if they do not fit in very well with the larger requirements which have arisen in these days, nobody can wonder at it. The latest understanding arrived at by the postoffice with the National Telephone company is a frank admission that competition over the same area is not merely inexpedient but impossible, and the state merely claims the trunk lines as being part and parcel of its main telegraph system. Co-operating in this way it is not unlikely that the company's administration will go on improving to the level of the one administered by the state; and whether the whole may finally fall into the hands of the postoffice will depend very much on how far this dual arrangement contrives to work harmoniously to the satisfaction of the public. There is no half-way house between state acquisition and state abstention, except possibly that which has been already arrived at.

Of the many "progressive" suggestions which came out into the light in the committee room, none was more prominent than that of municipal telephones. The supporters of this latest development of municipalization did not, as we have before remarked, cut a very impressive figure. Against the running of local telephone exchanges by local authorities there is the very obvious argument that where the government itself has failed to compete successfully with the company which at present holds the field, no municipality, however powerful, could possibly succeed. The same considerations which have prevented the state from pursuing a competitive game, namely, the taxpayers' pockets, might be expected to operate in the case of local authorities. There is, however, something to be said in favor of the practicability of municipal telephony. England and Scotland afford many striking examples of what can be done municipally wherever a strong municipal spirit is in existence. When two companies compete in the same town telephone users are moved to cast in their lot with one or the other by purely business motives; the concern which can induce the public to believe that it offers on the whole the better service will win, and the advent of the day of victory will be hastened by the innumerable petty vexations inherent to the rivalry of the two exchanges. But given the existence of a real grievance against the telephone company and an able municipality backed by a powerful municipal spirit, and we should be sorry to risk the dogma of editorial prescience and omniscience by dogmatically predicting disaster. With the magnificent network of trunk wires on its hands, the National Telephone company was, indeed, in an impregnable position; but to-day the trunk wires are open to all comers and municipal telephony has as good a chance as it is ever likely to have. Whether it is economically expedient or morally right to adventure the ratepayers' money in such a campaign of competition is a big question, which we need not now discuss. All we contend is that municipal telephony cannot be contemptuously dismissed as utterly impracticable, and that one single successful instance of it would in all probability save the necessity of a second.

One of the most useful pieces of evidence furnished to the committee was that by Mr. Staats Forbes, the president of the National Telephone company, giving statistics of users and charges for this and other countries where the telephone is in popular demand. We have never been the apologists of this company; but we gladly admit that the figures adduced by its able representative before this parliamentary committee go far to exculpate the management from many of the accusations which have been freely hurled against it for many years past unchallenged. Compared with those of other countries, its charges are not higher and its services are not less efficient or popular when the national conditions are fairly taken into account. No importance can be attached to statistics of complaints against this one company, seeing that no corresponding efforts have been made to obtain similar figures from other countries. If a round-robin could be got from all quarters we suspect that a majority could be obtained for voting the telephone an unmitigated nuisance which everybody would wish to see abated and perhaps even abolished altogether. And this, not because of its defects, but by reason of the demands it makes on the nervous energies of its users. But it is too late to consider their nerves; the only question is the efficiency of the service; and obviously this can best be obtained by a system which is virtually controlled by one administration.

## Telephone Construction Notes.

Reports from the South and Southwest indicate that considerable work is being done in that territory in developing the telephone field. A correspondent announces that the people in that section have got tired of paying high rates and have decided to cast their lot with new companies. "They are paying no attention to 'recent decisions,'" says this correspondent, "but are going ahead putting in telephones, and the new exchanges are making rates that will enable everybody to subscribe." As evidence of what has already been done this correspondent gives a list of recent installations by Bottenfield & Wood of Carthage, Mo., the general western agents for the American Electric Telephone company of Kokomo, Ind. Among these installations are the following: Joplin, Mo., is putting in an exchange, using the 'Hunnings' long-distance 'phone, manufactured by the American Electric Telephone company. The company was organized last winter, and every one of the subscribers is a stockholder; the exchange has 200 or more subscribers. Galena, Kan., has organized a telephone exchange, and Bottenfield & Wood are finishing the 'phone and switchboard. Carthage, Mo., has got one of the largest list of subscribers of any city in Southwest Missouri. A private company, called the American Telephone company of Carthage, has just been organized. This company will build a line to Webb city and Carterville, and put in an exchange there, and these will connect with Joplin, Mo., and Galena, Kas., and give free service to all its subscribers over its 30 miles of line. Neosho, Mo., capitalists are put-

ting in an exchange of 100 instruments made by the American Electric Telephone company of Kokomo, Ind. Frederick H. Brown is putting in a fine telephone system of 200 telephones at Parsons, Kas. The equipment was supplied through Bottenfield & Wood of Carthage, Mo. Mr. Brown will use the 'Hunnings' long-distance 'phone, made by the American Electric Telephone company of Kokomo, Ind. Parsons had the old Bell system, but has discarded the entire outfit. Lickwood and Greenfield, Mo., have been connected by a telephone line, and 18 to 20 'phones have been placed in each town. The line is being operated by Wheeler & Mann of Greenfield. They use the 'Hunnings' instruments.

The Aberdeen, S. D., telephone exchange is equipped with new instruments purchased from the Standard Telephone & Electric company of Madison, Wis. The Western Electric Telephone company of Britt, Ia., has contracted with the Standard Telephone & Electric company of Madison, Wis., for 10,000 telephones, to be used on the toll lines and exchanges through Iowa, Southern Minnesota and South Dakota. This is undoubtedly the largest contract ever made for telephones. The Western Electric Telephone company already has 600 miles of toll lines completed.

A dispatch from Indianapolis says: Prominent capitalists of this city have organized the Phœnix Telephone company and are asking for a franchise with a view to aggressive opposition to the Bell monopoly. The new company has agreed to establish an exchange and put in instruments at $30 a year for business houses and $20 a year for residences, and will pay the city a percentage of the gross earnings in the event a franchise is secured. Their agents recently made a canvass of the city and secured 1,500 subscribers, four-fifths of whom are now patrons of the Bell company. Notwithstanding a general demand that the new company be permitted to come in, the Board of Public Works is insisting on conditions that may keep it out.

## Milwaukee Street Railway Taxes.

Among the important cases decided by the State Supreme Court at Madison, Wis., last week was that of the Milwaukee Street Railway company versus Anderson, city clerk, determining the right of the city to include the street railway company's franchise in the assessment roll for the purpose of taxation. City Clerk Anderson included the street railway's property in the assessment of 1894, placing the value at $2,063,000.

The common law writ of certiorari was issued out of the Circuit Court to the appellant as city clerk of Milwaukee and ex-officio clerk of the board of review of that city, to bring before the court the assessment of the relator's property for 1894 in order that it might be corrected, reversed or set aside. The Circuit Court reversed and set aside the assessment of $2,063,000 for franchises, together with tracks, etc., and also set aside assessments of $12,000 and $25,000 for the franchises of the Electric Illuminating company belonging to the company. The clerk appealed from this judgment. In his brief City Attorney Hamilton said:

The assessor of the Third ward testified that in making the assessment of $1,800,000 he estimated the track, right of way, etc., at about half, and the value of the franchise at about half. That the value of the track, etc., $900,000, is amply sustained by the testimony, is unquestioned.

The details of the assessment for 1894 against which the company protested are as follows:

| | |
|---|---|
| Real estate | $ 553,790 |
| Personalty | 200,000 |
| Franchises, tracks, poles, etc. | 2,063 000 |
| Merchants' stock | 5,000 |
| Personalty in Second ward | 2,000 |
| Franchises of Badger Illuminating company | 25 000 |
| Franchises of Edison Electric Illuminating company | 12,000 |
| Total | $2.860,790 |

This was an increase over the assessment for 1893 of $1,714.050. The objections of the company were solely to the items of $2,063,000, $25,000 and $12,000, for the three franchises, tracks, poles, etc. The judgment of the Circuit Court of Milwaukee county was affirmed. The decision settles only the matter of taxation for the year 1894, as the street railway company succeeded in bringing about the passage of a law by the last Legislature which provides that the company shall simply pay a percentage of its gross earnings to the city treasurer.

## Death of Henry W. Frye.

It is with sincere regret that the announcement is made of the death of Henry W. Frye at Folsome, New Mexico, on Thursday, June 20th. Mr. Frye had been compelled last fall to give up his work on the *Electrical World* and seek improved health in New Mexico. In September last he suffered a severe attack of pneumonia and in January he determined to visit New Mexico. Since that time little has been heard from him, but in a private letter from Clayton, N. M., under date of April 10th, he announced considerable improvement and at that time seemed hopeful, although evidently realizing the serious nature of his complaint. He wrote: "I am much improved in health, but far from well yet. I hope to return in the early fall and if I stop in Chicago, I shall certainly call to see you." The announcement of his death will, therefore, be a severe shock to his many friends.

Mr. Frye had been engaged in electrical journalism since April 5, 1892, when he took a position on the staff of the *Electrical World*. He had taken a course at Johns Hopkins under Dr. Louis Duncan, and was well equipped for his work. Mr. Frye was graduated from Colby University, Maine. He was an associate member of the American Institute of Electrical Engineers. Personally, Mr. Frye was a very estimable gentleman, and his death will be considered a personal loss by everyone connected with electrical journalism is this country.

## Accident in an Electric Light Station at Rochester, N. Y.

On Thursday evening, June 20th, Foreman Frank E. Grover of the Rochester, N. Y., Gas & Electric company leaned against a dynamo at the lower falls power house, where he was employed, and nearly lost his life. Grover had just gone to work when the other employes' attention was attracted by cries from the foreman, who seemed to lean over against one of the big power generators and then fall writhing to the floor. The current was immediately turned off and Dr. C. W. Wilbur was summoned. Grover was unconscious and apparently dead. Nevertheless the employes of the station set to work to resuscitate him. William Julian, William Ziegler and Ernest Roth labored fully three-quarters of an hour before there was any sign of returning life. Then respiration began slowly. Grover was still in a critical condition and the men worked over an hour before they dared cease in their efforts. Grover was removed to his boarding house, where it was found he was badly burned about the limbs and sides. The total voltage of the current with which Grover came in contact was between 2,000 and 3,000 volts. Grover is of course very weak after his terrible experience. His body is very lame and sore and his heart is weak, and on this account Dr. Wilbur prohibited him from talking more than was absolutely necessary, but to a reporter he made the following statement:

I can't tell you how the accident happened. I don't know myself. All that I remember is that I was standing near one of the dynamos, and the next moment I thought I was an angel; then I knew nothing at all until I awoke and found the doctor and the men working over me. When I returned to consciousness I hadn't the slightest idea what had happened and I was the most surprised man in the world when they told me that 2,899 volts had been pumped into me. I don't think that I leaned against the dynamo, as I have been an electrician too many years to do so foolhardy a thing. I must have moved my arm in such a manner that it swept the brushes, thus coming in direct contact with the current. My arms and legs feel stiff and lame and my muscles are quite sore. But I am feeling as well as a man can be expected after wrestling with lightning. I think I will be at work to-morrow all right.

Dr. Wilbur said that the man would recover beyond doubt, but that the vital organs had received too great a shock and were too weak to allow any exertion.

## BOOK TABLE.

TELEGRAPHERS OF TO DAY: DESCRIPTIVE, HISTORICAL, BIOGRAPHICAL. By John B. Taltaval. 1894. The Electric Age, New York. Price, $5.

It is not generally appreciated that many of the leading men in commercial, professional and public life to-day have at some period been engaged in telegraphy, but a glance over the list of those whose sketches and portraits adorn the pages of this work is all that will be required. The author announces that it was his intention to present portraits and sketches of those who are at present, or have been during the last fifty years, prominent in telegraphy. Mr. Taltaval's familiarity with this branch and his wide acquaintance with those engaged and interested in it gave him a decided advantage in the preparation of this work over any other person who would undertake such an exacting task. It is enough to say that he has faithfully performed the work, and as a result the book is an accurate and valuable contribution to electrical literature, and makes a very creditable souvenir for the fiftieth anniversary of telegraphy. It is handsomely printed, as might have been expected, and the mechanical features are in keeping with the importance of the work.

AMERICAN STREET RAILWAY INVESTMENTS. Edward E. Higgins, editor. 1895. The Street Railway Publishing company, New York. Price, $3.

The publishers have endeavored to make this year's edition more accurate and complete than the last work. A feature of this issue is the introduction, in which the experience of the year, in all the principal cities of the country, is briefly reviewed, and the outlook for the coming season reported. Other special features of the work are: The municipal statistics of the large cities; clearness in arrangement, brought about by the liberal and systematic use of sub-headings and tables; the maps of the principal systems; careful indexing; accuracy due to the fact that proof has been sent to every street railway company for revision in advance of publication. All of these are very excellent features of themselves, and when combined they contribute largely to the value of this work.

ELECTRICAL ENGINEERS AND STUDENTS' CHART AND HAND BOOK OF THE BRUSH ARC LIGHT SYSTEM. By H. C. Reagan, Jr. 1895. Norman W. Henley & Co., New York. Price, $1.

This is the second work that has been placed on the market for the avowed purpose of giving the student, engineer and dynamo tender an opportunity to familiarize themselves with the design, construction and operation of the apparatus manufactured by one company. It contains descriptions of the very latest Brush dynamos. It is important that those having charge of the care of these machines should understand them fully. A feature of the work is the revolvable celluloid chart, representing a Brush dynamo with a revolvable armature. It shows the manner of cutting the lines of force, the directions of the flow of current induced in the armature coils; the method of commuting the current; the flow of current to the external circuit and return to the negative brush. The action of the chart is the same as a real Brush dynamo. The book also contains data on the Brush system of arc light dynamos, giving the numbers, capacity, and standard dimensions of horse power required for each dynamo.

THE TELEPHONE SYSTEMS OF THE CONTINENT OF EUROPE. By A. R. Bennett. 1895. Longmans, Green & Co., London and New York. Price, $4.50.

Inasmuch as the conditions under which telephone exchange service in this country is conducted are very different from those that obtain in Europe, the facts and data furnished in this book, valuable in and of themselves, are not of any special practical importance her . Yet there is much valuable information contained in its pages, and as an historical work and for reference it is a valuable acquisition, especially at this time, when data of the kind contained in it are eagerly sought.

## Street Railway Changes at Washington, D. C.

W. L. Elkins, P. A. B. Widener, and Thomas Dolan of Philadelphia have disposed of all their interests in street and suburban railroads in the District of Columbia to the Maryland capitalists who are interested in the building of the boulevard electric railroad between Washington and Baltimore. The holdings of Messrs. Elkins, Widener and Dolan comprised the majority of the stock in the Eckington and Soldiers' Home and the Belt Line railroad. The value of the stock in both companies was in the neighborhood of $1,000,000. The Philadelphia gentlemen, who are recognized as forming the most powerful street railway syndicate in the United States, secured the control of the Eckington and Belt Line roads in February, 1893. Both ventures were losing ones at that time. Since then a large amount of money has been expended upon them, notably in the extension of the Eckington road in the northeastern section of the city. Under the control of the Philadelphia syndicate the business of the roads increased to a certain extent, but not sufficiently to admit of such large capitalists finding their permanent ownership without other connections sufficiently profitable as an investment. In connection with the Boulevard road, however, and as a means of giving this important line an entrance to every portion of Washington, it is confidently expected that the Eckington and Belt system will be of immense value to its new owners. President Newbold, representing the Baltimore gentlemen who have always held a considerable interest in the roads, will remain as president of both lines. It is expected upon the completion of the Boulevard line that a new system of rapid transit will be introduced on the Belt line as well as the Eckington. In this connection it is interesting to note that the work upon the Boulevard road between Washington and Baltimore is progressing rapidly. Construction parties have been organized, and all the plans necessary to the rapid completion of the work have been arranged. The contracts that will shortly be awarded, the specifications of which are now being drawn, and which in many instances are being considered by builders, call for the completion of the entire road in the spring of 1896.

## Electrical Securities.

[From the *Boston Herald*.]

General Electric was affected unfavorably by the statement given out early in the day that Manhattan elevated had closed a contract with the Westinghouse instead of General Electric for electrical equipment of the road. Later it was asserted by Manhattan officials that a contract for the equipment of the elevated railroad with electricity had not been given to the Westinghouse or any other company. Mr. Sage says that Mr. Westinghouse has been at work on the problem for a long time, as have other electrical interests.

A General Electric official says: "It is quite probable that the Westinghouse manager has made an arrangement with Manager F. K. Hain to look over the Westinghouse plant, but this does not necessarily mean a sale of the equipment. Negotiations between Manhattan and General Electric have been in progress for a long time. Manhattan has been waiting for the practical operation of the Metropolitan West Side elevated of Chicago, which was recently supplied by General Electric. We have every reason to believe that engineers' reports of these operations have not yet been rendered."

## Weston Instrument Company's Removal and Extension.

The Weston Electric Instrument company, of which Prof. Edward Weston is the head, has found its quarters too contracted in the building at the corner of William and Shipman streets, Newark, and has arranged for an extensive plant at Waverley, N. J. The company has purchased about 48 acres of land on both sides of Frelinghuysen avenue for the purpose. This will be opened up in building plats for employes of the works, and the property will be rented or sold upon easy payments to the employes of the company. About 100 cottages will be built upon this tract by the company. The factory tract extends 905 feet on Frelinghuysen avenue, 326 feet on the road to the station, 1,413 feet on the line of the Pennsylvania railroad and 1,286 feet upon the south side. On the large tract between the avenue and the radroad the factory buildings will be erected. They will be modern structures, with immense floor space, and not exceeding two stories in height. In addition Prof. Weston will erect a model laboratory on the tract and will equip it with fine machinery, instruments of accuracy and a complete stock of chemicals. Prof. Weston has other things in view besides the manufacture of his direct-reading voltmeters and ammeters, and will begin upon a new line of work as soon as the details of the present line of manufacture are completed and the new plant is in perfect operation. It will be a model establishment in every respect, and it is proposed to employ nearly 1,000 persons at the Waverley shops. Every detail of the work will be systematized thoroughly. The actual work of building can hardly be started until early in September, as the plans are not yet made. The buildings upon the factory tract will all be constructed of steel and brick, with a view to making them as nearly fireproof as possible. A spur will be run into the yard from the Pennsylvania railroad when the plant is completed, and the company will thus have every facility for getting stock and fuel and for shipping its products. At the same time it will have the advantage of the proximity of the Lehigh Valley road on the west and the trolley line on Frelinghuysen avenue.

## The Pacific Cable.

[From the New York *Sun.*]

Nearly twenty months ago, when, on October 16, 1893, the first telegraphic message was flashed between Bundaberg, in Queensland, and Gomen, in New Caledonia, Audley Coote, at the resulting festivities, proposed as a toast: "Success to the first section of the Pacific cable," mentioning with praise the name of M. Rouilliard, as "director of the first section." It was thus made evident that, while the immediate purpose of that wire was to join New Caledonia to Australia, France furnishing the greater part of the subsidy and Queensland and New South Wales the rest, the projectors already meant to carry it across the ocean.

Now we hear that Mr. Coote, representing the company that laid this cable, is in Hawaii prosecuting a plan for its extension, and intends to present it also to Congress next winter, at least in relation to the section which he desires to lay between Honolulu and Monterey.

We do not understand that this Australian-French enterprise has anything to do with the British undertaking represented by Messrs. Fleming and Mercer, which was laid by Mr. Cleveland before congress last winter, with a view to the acquisition of a landing station for it in Hawaii. The company which Mr. Coote represents is the Société Française des Télégraphes Sous-marins, and both the British government and the Dominion are said to have looked with some uneasiness, if not jealousy, upon its purpose, so that what was done at Ottawa last July in favor of a cable between Australia and Canada had been considerably stimulated by the success of this French enterprise. A portion of the British press deprecated any assistance to the extension of the French line to the American coast. Nevertheless that company is in the field, with the advantage of nearly 800 miles already laid.

What interests our own country in the matter is the proposal of the French company to land at a California port, and to arrange that the entire section between Honolulu and Monterey shall either be owned by our government or controlled by it. That is a very different proposition from the one offered to Congress last winter, namely, the furnishing of our consent to the lease of a Hawaiian island for a British cable which was to terminate at Vancouver. The soundings taken by the Thetis and the Albatross, under the authority of Congress, for an American-Pacific cable, were between Monterey and Honolulu, and between Point Conception and Hilo bay. At Monterey bay the shore incline is said to be well protected, as it may also be in the Santa Barbara channel.

Besides the 792 miles of wire already laid between Bundaberg and Gomen or Noumea, the existing enterprise has a reasonably direct route in view by way of the Fijis, Samoa, Fanning, Honolulu, and Monterey. It certainly gains over 300 miles in the last stretch, over a line terminating at Vancouver.

However, the line which will receive encouragement from Congress may be a wholly new one, and American throughout. Such a company could make its own arrangements with the French line or any other for extension beyond Honolulu to New Caledonia, or to Japan. Indeed, the project before Congress last winter was that the government itself should build, own, and operate the line. Whether this is to be the final form of the enterprise or not, we may hope and expect that when Hawaii comes into the Union an American cable will bind her to the mainland.

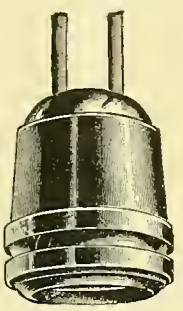
## Theosophical Electricity.

Apropos of the fact that Mrs. Besant, the leader of the English theosophists, claims to have had an interview with a mahatma, and noted the interesting phenomenon of throbbing electricity throughout the room, Prof. S. P. Thompson of London, with characteristic scientific ardor, has written the following letter to the *Westminster Gazette:*

As the whole mahatma business depends, not on the *bona fides* of the narrators, such as Mrs. Besant, but on the competence and accuracy of their observations, permit me to point out a very simple line for testing such accuracy. In your interview with Mrs. Besant you report her as saying that on the occasion of the mahatma appearing to her the room was throbbing with electricity. Now that is a very clear and simple statement. But is it supported by the slightest evidence? Did Mrs. Besant use an electrometer to measure the degree to which the room throbbed? If so, was the electrification positive or negative? Or was it alternating in sign? If so, how many volts did the electric potential change, and what was the frequency of the change? Was it once a second, or once a minute? Or was it a high frequency such as 100 a second? If no electrometer was used how is it known that there was any electric action at all? Did the room itself throb, or did the air only in it throb? If the latter, how could the potential of the air alter without affecting the material objects and the walls? Lastly, were any optical tests applied to ascertain (as can be done without any apparatus) whether that which was seen was objective or subjective? In short: What are the hard facts?

## Trolley Measures in the Chicago City Council.

At last week's meeting of the Chicago City Council the ordinance of the Chicago Passenger Traction company was passed granting the company a twenty-year franchise to operate an electric line on the following streets: On Fullerton avenue from Milwaukee avenue west to the city limits, on Central avenue north from Fullerton avenue to Maywood



MEDBERY WEATHERPROOF SOCKET.

avenue, thence on Maywood avenue northwesterly to the city limits, on Tanner avenue from Bryn Mawr avenue northwesterly to the city limits.

Resolutions protesting against the erection and maintenance of trolley wires as dangerous and a hindrance to the fire department in the business district, which were adopted at a meeting of the Chicago Fire Underwriters' association, were presented at the same meeting and referred to the committee on fire and water.

## Medbery Weatherproof Socket.

The superiority of the Medbery weatherproof socket has been thoroughly demonstrated in its use for illuminated sign work as well as for other special work. There can be no danger from fire, as all the connections are inside, while the composition, which is absolutely waterproof, is forced around them under enormous pressure, making a socket of great strength and durability and one that is practically indestructible. Water cannot follow the wires and make a short-circuit.

The Mason Electric Equipment company, 307 Dearborn street, Chicago, is the western agent, and it keeps a stock on hand in its warehouse.

## Villard and the North American Company.

Just now the affairs of the North American company are receiving attention among eastern capitalists. The New York *Sun* says:

There are no indications that Villard, who was the original promoter of the North American company as a blind speculative pool under the title of the Oregon & Transcontinental company, has any interest whatever at present in its securities. He certainly has no voice in its management. The present directors represent themselves and other stockholders who suffered on account of Villard's reckless mismanagement of the company, and whose only aim is to save what they can from the wreck he bequeathed them when he retired from the management. In pursuance of that policy, the loans of the company were recently transferred to friendly hands, and steps have been taken to reorganize the Milwaukee Street Railway company upon a basis that will make its securities marketable, and thus enable the company to liquidate its indebtedness. The present management has nothing to conceal, and any stockholder who is interested solely in conserving and improving the value of his security can without difficulty obtain full information regarding the affairs and prospects of the company.

## A Model Chinese Lighting Station.

[From the Shanghai, China, *Gazette.*]

The new electric light station which the municipal council of Shanghai is erecting at the corner of Yuhong and Fearon roads, is of bold and handsome proportions, its design having evidently been to combine a striking exterior with internal adaptability to the purposes for which the edifice is intended. The building throughout is constructed of blue and red brick, and the most striking feature about it is the tall chimney, which will be the largest in Shanghai, measuring 120 feet in height, with an internal diameter of seven feet, the outside diameter at the base being 20 feet, from which it will gradually taper to 13 feet at the top. The engine house measures 116 feet in length by 35 feet in breadth and 25 feet in height.

It is intended to place no fewer than 14 compound horizontal surface condensing engines by the firm of Marshall & Co. of Gainesborough, England, whose machinery seems to be growing in popularity in China, there being now some 40 engines manufactured by them working in Shanghai alone.

The dynamos for arc lighting are by the Brush company of Cleveland, O., and the alternators, switches, transformers and such instruments are the work of the Brush company of England.

The boiler house is also a very spacious and lofty apartment, in which will be placed three Lancashire boilers, each measuring seven feet by 28 feet, and capable of sustaining a daily working pressure of 140 pounds. These three boilers are the largest of the description in Shanghai. There will also be two locomotive boilers working at the same pressure.

Adjoining the electric light station are two nice, airy dwelling houses for the superintendent and assistant superintendent. The superintendent's office and workshop adjoining will be fitted up with all of the most modern electrical appliances. All the buildings are roofed with galvanized corrugated iron, with the exception of the dwelling houses, which are roofed with Marseilles tile.

## Poor, Persecuted Bell Company.

[From the *Boston Herald.*]

The opinion of the United States Circuit Court of Appeals in the Bell telephone case, as written out by Judge Putnam, not only absolves the Bell company from the charge of having conspired with the Patent Office officials to delay the issue of the Berliner patent for their own benefit, but it turns the tables by declaring that if there was any dereliction of official duty it was in the form of a continued hostility to the Bell company, and of an indisposition to grant the application for the Berliner microphone, with a concurrent disposition to nurse and favor the Drawbaugh application, either for its own direct advantage, or for the purpose of defeating inventions controlled by the Bell company. The government is thus smartly rebuked in its own court and it seems to have deserved it.

## Unique Electrical Experiment.

The following interesting narrative is from the "Scientific and Technical Papers" of W. von Siemens:

I stood upon the highest point of the pyramid and held up my own forefinger in the air. There was a slight, hardly perceptible prickling observable on the skin of the finger which was opposed to the wind. I could only explain this fact, observed by all of us, as an electrical phenomenon, and such it proved to be. When I held up a full bottle of wine, the top of which was covered with tinfoil, I heard the same singing sound as when the finger was held up. At the same time little sparks sprang continually from the label to my hand, and when I touched the head of the bottle with my other hand I received a strong electric shock. It is clear that the liquid inside the bottle, brought into metallic connection with the metallic covering of the head of the bottle through the damp cork formed the inner coating of a Leyden jar, while the label and hand formed the outer coating. When I had completed the outer coating of my bottle by wrapping it in damp paper, the charge was so strong that I could make use of it as a very powerful weapon of defense.

After the Arabs had watched our proceedings for a time with wonder, they came to the conclusion that we were engaged in sorcery, and requested us to leave the pyramid. As their remarks, when interpreted to us, were without effect, they wanted to use the power of the strongest to remove us from the top by violence. I withdrew to the highest point and fully charged my strengthened flask, when the Arab leader caught hold of my hand and tried to drag me away from the position I had attained. At this critical moment I approached the top of my flask to within striking distance of the tip of his nose, which might be about ten millimeters. The action of the discharge exceeded my utmost expectations. The son of the desert, whose nerves had never before received such a shock, fell on the ground as though struck by lightning, rushed away with a loud howl, and vanished with a great spring from our vicinity, followed by the whole of his comrades. We had now a full opportunity of carrying out our experiments.

## Chloride Accumulators on Paris Railways.

Attention is called to the fact that chloride batteries are used on the electric railways of Paris operated by accumulators which were described and illustrated in the WESTERN ELECTRICIAN June 22d. These batteries are manufactured by the Electric Storage Battery company of Philadelphia.

# CORRESPONDENCE.

## New York Notes.

NEW YORK, June 22.—General Manager F. K. Hain of the Manhattan Elevated Railway company, since his return from his trip of inspection to the Westinghouse shops, says that his company proposes to let others do the experimenting on electric elevated railways. "When I get the time," he says, "I am going to Chicago to see the electric system in use on the Metropolitan elevated railway in that city, and also to Schenectady, to see the General Electric company's system there. Nothing definite has been decided yet. We intend to go slow and watch developments." Colonel Hain said that he had made no report to the directors, unless informal talks had with one or two of them could be construed as a report. It is reported that the officials of the Manhattan company are very favorably impressed with a modification of the Wheeless underground system which it is proposed to apply to the elevated structure. By this plan the conducting rail is cut into sections and only that portion under the passing car is in the power circuit. The Westinghouse company, having absorbed the Electro-magnetic Traction company, has secured control of the Wheeless patents.

The hearing on the appeal of the Nassau Electric Railroad company and the Kings County Electric Railroad company, commonly known as the Flynn roads, from the judgment of Justice Smith of the Supreme Court, declaring their franchises void and stopping the construction of the roads, took place a few days ago before Justices Brown, Dykman and Pratt, composing the General Term of the Supreme Court in Brooklyn. Elihu Root, counsel for the companies, contended that the income which would accrue to the city on the percentage basis agreed upon would be about $29,124 a year, a sum much greater than the interest offered by the unsuccessful competing companies. In closing Mr. Root said the court had no right to touch the franchise unless the strongest external proof of fraud was adduced. Jesse Johnson for the respondent went over the line of argument he followed when the case was before Justice Smith. He asserted that the franchises were void, having been granted without any competition as to the rate of fare, and he also maintained that the franchises were worth $2,000,000. The justices reserved their decision.

In Albany there is considerable unfavorable comment owing to the fact that without giving any other contractors a chance to bid, the capitol trustees have awarded to the Municipal Gas company of Albany the contract for lighting the capitol by gas and electricity at $30,000 a year for three years. After doing this the fact that the contract had been awarded was kept as secret as possible. At the executive chamber, however, it was thought best to make this statement: "The Board of Trustees of Public Buildings has authorized and approved a contract made on May 15th by the superintendent of public buildings with the Municipal Gas company of Albany for the gas and electric lighting of the capitol and the executive mansion at $30,000 per year for a term of three years. The contract was approved as to form by the attorney-general and will result in a saving of about $10,000 a year and avoid the necessity of renewing the electric machinery at the capitol, estimated to cost $60,000." On the other hand, it is stated that the Municipal Gas company is furnishing the state with some ancient relics in the shape of dynamos in lighting the building. To purchase new dynamos, it is estimated by people well versed in the matter, would cost about $12,000 annually and to run the plant would not require more than $15,000.

The following are the names of the officers elected at the annual meeting of the New York Electrical society, held on the 18th instant: President, John W. Lieb, Jr.; vice-presidents, Herbert Laws Webb, Edward Caldwell, Francis Forbes, Nelson W. Perry, Prof. L. H. Laudy, Prof. Morris Loeb; secretary, George H. Guy; treasurer, H. A. Sinclair. From the secretary's interesting report these extracts are taken: "There have been five deaths and eight resignations during the year; 33 members have been elected, and the net increase in membership is 20. The number of members now on the books of the society is 370. * * * Although last year the average attendance showed a marked improvement on the preceding year, during the season just concluded the society has had most gratifying evidence that its lectures have been on the whole even more thoroughly appreciated than ever. The range of subjects has been wide and in almost every instance the society has been fortunate in an able and exhaustive treatment of the theme selected. Some of the best lectures promised are still on the programme for next season, and will in all probability be delivered at an early date." W. F. O.

## Buffalo and Niagara Falls.

BUFFALO, JUNE 21.—A new electric trolley company which promises to provide a most successful financial investment for its 150 stockholders has been incorporated in this city. The new line will be known as the Buffalo, Gardenville & Ebenezer railway and is to be four miles in length and will run from the Buffalo city line along the Indian-church road to Gardenville and thence to Ebenezer. The board of directors is composed of the Hon. Charles F. Schoepflin, Ed. H. Ballou, Jacob Doetsch, William F. C. Trier, Gardenville; Charles Rung, J. Lester Osgoodby, Frank J. Bissing, Christopher Smith, S. C. Rogers, Will P. Smith, Buffalo; Michael Ansteth, Ebenezer, and Henry C. Lien, West Seneca. The company's principal offices will be at Gardenville.

William Morrison of the American Battery company has been here looking for a good site for his company, which is now located in Chicago. He has given it out as an assured fact that the company will locate at Tonawanda when the current is turned on at the Falls.

George P. Smith is about to open his trolley line from Buffalo to the Falls. The route is over the Buffalo cars to Hertel avenue; thence to the city line and to Tonawanda; from there by boat to Echota, and from that point by cars to the Falls.

W. B. Rankine, secretary and treasurer of the Cataract Construction company, stated that when the meeting of the American Institute of Electrical Engineers is in session the delegates will have free access to the power house, the dynamos being run for their express benefit.

A project is on foot for the operation of an international street railroad belt line, starting at Niagara Falls, Ont., passing through Drummondsville down past the Clifton House and thence across to the American side over a new bridge that will be built adjoining the present new suspension bridge. If satisfactory traffic arrangements can be made some of the cars of the new line will run over the Buffalo & Niagara Falls road to Lewiston. The right of way on the Canadian side has been secured. Mr. Kyle of Toronto is one of the principal capitalists interested in the scheme. It is also proposed to build a branch line from the Grand Trunk railway station at Niagara Falls, Ont., to St. Davids and thence to the Whirlpool.

The consent of the stockholders of the Niagara Falls & Lewiston Railroad company for the increase of the capital stock from $100,000 to $400,000 has been filed with the county clerk.

County Clerk Bingham has received for filing the certificate incorporating the Buffalo, North Main Street & Tonawanda Electric Railway company. The company is capitalized at $75,000 and has the following named directors for the first year: S. W. Petrie, Thomas H. Feany and J. H. Pardee of this city; H. H. Crowell of Syracuse; John F. Farrell of Albany, and James O. Carr, H. M. Francis, C. G. Smedburg, S. D. Greene, Hindsill Parsons and Howard and C. Lewis of Schenectady.

Electricity will soon take the place of horses on the street railroad doing the local service of the three Canadian villages now known as Niagara Falls South, Niagara Falls Center and Niagara Falls, Ont.

Dynamo No. 1 has been running in the Niagara Falls power house to-day and ran rapidly and satisfactorily. Electrical tests are being made, the speed being 250 to 300 revolutions.

The Buffalo & Niagara Falls Trolley company has decided to erect a power house at North Tonawanda. The location of it will be on the north side of Sweeney street and on the Jackson property. The building will be of brick 96 by 60 feet in the clear, with engine and dynamo rooms. The work will be started at once. The new car sheds will cost $25,000 and will be 365 feet long by 75 feet wide and have a capacity for 40 cars. F. C. P.

## St. Louis, Mo.

ST. LOUIS, June 20.—In the mandamus proceedings instituted by the Laclede Gaslight company last fall seeking to compel the street commissioner to issue a permit to excavate streets and alleys and construct conduits for electric wires for lighting purposes, Judge Macfarlane of the state Supreme Court in banc has filed an opinion adverse to the gas company and thereby sustaining the action of the street commissioner. The Laclede Gaslight company has long contended that it held unusual rights and privileges under its old state charter and this decision is regarded as a victory for the city. Briefly outlined, the cause of this suit is as follows: Last October the Laclede Gaslight company, after giving notice, but without formal permit, began to excavate on Broadway and Mound streets for the purpose of constructing a conduit in which to lay wires for lighting purposes. The work was stopped by the street commissioner. The gas company then made formal application for a permit to excavate the streets for the purpose. This application was refused, on the ground that the gas company had no municipal franchise authorizing such work. The gas company then instituted mandamus proceedings in the state Supreme Court. It was expected that the court would incidentally bring up and pass upon the broad features and claims of the gas company, but to the contrary it has passed over all such matters and confined its attention entirely to the subject matter as indicated by the title of the proceedings.

The Missouri Electric Light & Power company is making arrangements for the installation of two large alternators, each of 1,000 kilowatts capacity. They will be directly connected to two engines of the marine type, made by the Lake Erie Engine company, each engine having a capacity of 1,800 horse power. These large alternators are of the two-phase type, but are designed so as to give two or three-phase or monocyclic currents and are over compounded for 20 per cent. overload. They will be worked in multiple and will supply current to the Edison station or to the Missouri company's territory as may be required to accommodate the night and day loads. These large units are being built on special designs made by H. A. Wagoner, general superintendent of the Edison and Missouri lighting and power companies. The entire arc light service of the city will be carried by four large alternators of the Edison and Missouri companies. By means of step-up converters, located in the power stations, the 1,000 volt current will be changed to 3,000 volts. The regular series arc circuits, each circuit carrying 60 arc lamps, will be supplied from the 3,000 volt secondary of these step-up converters. The regular direct current arc lamps are being changed so as to enable them to work with alternating currents, but no other change in apparatus will be necessary. By the use of these large alternators and this radical change in the arc lighting system the companies will be enabled to improve their service in every way and also reduce their operating expenses. Arc and incandescent lamps and power currents will be supplied by one type of generator—the multiphase alternators.

During the session of the State Legislature last winter an act was passed authorizing municipalities to sell to the highest bidder all public franchises. The city counselor has declared this law to be unconstitutional. So far as it relates to street railways it is contrary to the state constitution, which prohibits the Legislature from making any laws on the subject. The sale of city franchises is left entirely with the municipalities. Aside from this the city counselor points out that the method provided for regulating the amount to be paid to the city is an impracticable one. From this it seems that the city can regulate such matters by its own ordinances, a position which has heretofore been questioned. R. J. H.

## Milwaukee, Wis.

MILWAUKEE, June 22.—The new law in regard to the taxation of street railways provides that they shall pay a percentage of their gross earnings in lieu of all other taxes and that they shall file with the city treasurer on December 1st a statement which shall show what the gross earnings of their lines have been during the twelve months preceding, and that on or before the 1st of February following they shall pay to the treasurer a sum equal to 1 per cent. on the first $250,000, 1½ per cent. on the second $250,000 and 2 per cent. on all earnings in excess of $500,000. The amounts so paid are to be in lieu of all taxes so far as the city is concerned, but the companies must pay county, state and school taxes just the same as they have done in the past. The city treasurer is required to pay to the county treasurer 9 per cent. of what he receives and the county treasurer must pay to the state treasurer a third of what he receives.

The new law in regard to vestibuling street cars provides that half of the winter cars shall be provided with vestibules by the end of the present year and the balance by November 1, 1896. Receiver Payne of the Milwaukee Street Railway company is doubtful whether the work of putting vestibules upon the cars can be done in time and the lines operated as at present. The law, he states, does not give sufficient time to make the changes, as every car will have to be taken off the lines and sent to the shops, and the time between seasons is not sufficient to do this. The changes will cost the Milwaukee Street Railway company thousands of dollars. The company has about 150 cars that will have to be changed to conform to the law. Similar laws are in effect in Ohio, Minnesota, Michigan and several other states.

The suit of H. B. Tanner, F. M. Charlesworth and H. C. Tanner of Kaukauna against the Kaukauna Electric Light company, John Earles of Kaukauna and Dr. W. H. Earles and A. Bunke of Milwaukee, for the appointment of a receiver for the company, has been denied by the Circuit Court of Outagamie county. It was charged by the plaintiffs that the defendants had been guilty of fraud, and had so managed the affairs of the company as to cause a depreciation in the value of the capital stock. In their answer the defendants denied all the charges made in the complaint, and brought forward some counter-charges.

The Milwaukee Board of Public Works has advertised for an electric tower clock for the new city hall. The Johnson Electric Service compaoy has made a proposition to the board to put in a small clock anywhere in the building and connect it with the 15 foot dials in the tower by a system of air tubes. The company asserts that this system will ensure exact time, and that the cost will be much lower than that of the ordinary system. It is proposed to connect all the clocks in the city hall and operate them by this air system, only the dials and the small works necessary to move the hands being used except in the principal works.

Robert Duerr, of the firm of Duerr & Rohn, whose death occurred recently, was one of the pioneer electricians of Milwaukee. He was born on a farm near this city and his business career covered a period of thirty years.

All the electric wiring in the Pabst building, the costliest business block in the city, and one of the newest, has been done over recently. There were several leaks in the old system, and the electricians could not locate them. The work of rewiring the building was a decidedly expensive one, costing several thousand dollars, but it had to be done.

The Bucyrus Steam Shovel & Dredge company of South Milwaukee recently shipped to the Gold Dredging company of Red Rock, Mont., the first electric elevator dredge ever built.

The new Waukesha Beach electric railway will be opened next Tuesday with a great deal of ceremony. There will be speeches, a banquet and a general jollification. Mayor Swift of Chicago is expected to be present. The road, which runs from Waukesha to Pewaukee Lake, has been in operation for several weeks. It is expected to be a profitable enterprise.

Receivers Henry C. Payne and George R. Sheldon have been authorized by the United States court to pay the interest on the $1,000,000 of bonds issued by the Milwaukee City Railroad company and upon $500,000 of bonds issued by the West Side Railway company. These bonds are prior liens upoo the property and the interest upon them has to be paid.

The new transfer system, according to General Manager Wyman, has had little effect upon the receipts of the Milwaukee Street Railway company. The system is a general one, in a way, but no passenger is allowed more than one transfer. Mr. Wyman is of the opinion that the new system will eventually reduce the receipts, but not much. The time limit now in vogue and the fact that the passenger must state, as soon as he gets on the car, just what line he wishes to be transferred to, have stopped the abuse of the transfer system.

The Milwaukee Street Railway company is still opposing the effort of the Wauwatosa line to get a franchise into the city and has succeeded in having action delayed again.

The matter of interurban electric railways in the Fox River valley is still a matter of uncertainty. There has been a fight between the Central Wisconsin Electric company and the Oshkosh Street Car company. The Wisconsin company's line was supposed to enter Oshkosh by way of Jackson street, but the Oshkosh company got possession again of all that part of Jackson street lying north of New York avenue, which compels the other company to "go around" and bring its own cars to the fair grounds.

The Janesville street railway system averages about $100,000 a month in gross earnings, a sum which is barely sufficient to keep the lines in operation. There is talk of several extensions, which it is thought would make the system profitable. C.

## Northwestern Notations.

MINNEAPOLIS, June 22.—Judge Nelson has handed down a decision in the United States Circuit Court in Duluth, Minn., declaring H. B. Moore receiver for the Great Western Manufacturing company's plant at West Duluth. Moore was appointed by the District Court in Duluth, while E. H. Fowle was appointed receiver by the federal court in Chicago. The latter took no steps to secure possession of the West Duluth property until Moore had been appointed receiver, and his negligence enabled Moore to win the suit. No damages were granted. It is thought that the First National Bank of Chicago will release its bill of sale to all the personal property of the company, given to secure indebtedness.

The Hastings, Neb., electric light plant was sold on a mortgage held by Adam Cook, Jr., of New York, for $13,000. It was bought in by Mr. Cook for $10,000.

General Manager Erb, of the Leavenworth, Kas., electric lines, has bought a searchlight which was used at the World's Fair and will use it at various points on the electric lines during the summer. A balloon ascension at night is proposed, the balloon to be followed up and down with the searchlight.

Prof. Geo. D. Shepardson of the University of Minnesota is drawing plans for the Willmar, Minn., electric light plant, to cost about $8,000.

Iosurance rates in Council Bluffs, Ia., have been raised one per cent. where electric motors are used.

Lanesboro, Minn., is having an electric light plant put in and will dedicate the plant July 4th.

Work has been begun on the light and power plant at Bayfield, Wis.

It is understood that the Clark Water Power company and the Electric Lighting company of Stevens Point, Wis., will consolidate. If the deal is consummated a new electric power house will be built at the dam to furnish power for the lighting plant and for the prospective street railway.

John A. Cole estimates the cost of an electric light plant for La Crosse, Wis., at $25,000.

The Vermillion Milling company of Vermillion, S. D., has ordered electrical equipment for a 1,200 light electric plant.

Worthington, Minn., has voted to put in a $15,000 electric light plant.

Jackson, Minn., people think they want a 1,500 incandescent light and a 50 to 75 arc light electric plant.

George Nelson proposes to build an electric line between Aberdeen and Hoquiam, Wash.

The Mason City, Ia., Electric Light company has been reorganized and Mrs. M. I. Clark elected president, T. S. Roberts secretary and treasurer. They expect to put in at once an electric street car line.

An electric light plant will be in operation at Roseau, Minn., by June 15th.

The real estate board has passed condemnatory resolutions on the "midnight policy" of the Oshkosh Street Railway company. The latter announces it will probably substitute electricity for horse power at the annual meeting next month.

Fremont, Neb., will put in a municipal electric light plant.

The Omaha Street Railway company will have the Lake and Thirtieth street line to Bedford place changed into an electric line in 30 days.

The City Council of Sheboygan, Wis., passed the contract to the electric lighting company for 10 years at $95 per light over the veto of Mayor Born. Work on the street railway line is now assured. C.

## PERSONAL.

H. H. Brooks of the American Circular Loom company, Boston, spent a few days last week in Chicago.

## ELECTRIC RAILWAYS.

Bids have been called for by the Washington & Great Falls Electric Railway company for an issue of $100,000, first mortgage 6 per cent. thirty-year gold bonds, part of the total authorized issue of $500,000.

The building of the Buffalo, Gardenville and Ebenezer road from Buffalo, N. Y., along the Indian church road to Gardenville to Ebenezer is now assured. The trolley will be used. The directors have chosen the following officers: President, Charles F. Schoepflin of Gardenville; vice-president, Dr. E. H. Bellow, Gardenville; attorneys, Hodson & Webster.

In the Circuit Court at Rochester N. Y., last week the jury in the case of Penny against the Rochester Electric Railway company brought in a verdict of $5,000 for the plaintiff. The plaintiff is a child of eight years and sues by guardian. He was injured while returning from school. His right leg was amputated close to the hip in consequence of the injury and he will be a cripple for life. The question in the case was, of course, whether the motorman was negligent.

## MISCELLANEOUS.

About one person in every 100,000 was struck by lightning in this country last year, a fact which leads the *Chicago Tribune* to remark that the average human being is in a great deal more danger of being elected alderman or run over by a trolley car than of being struck by lightning.

According to Charles Booth, in his latest volume of "Life and Labor of the People in London," the great majority of men employed in all the branches of electrical work in London are under 25 years of age. It is also stated that of some 5,000 men engaged in different electric works only 13 per cent. are members of a trade union.

The jubilee of car horses has come in Philadelphia, says the *Chicago Tribune*. Monday, the 17th inst., the last horse car line disappeared with the advent of the trolley cars on the Baring street branch of the Philadelphia Traction company's system. In a few days the last of the cable lines will also go, and electricity will be the only motive power in the entire city. Evidently also the jubilee of horses is on the way for New York, as a demonstration is to be made in a few days to prove to the owners of department stores that mechanical power is cheaper and more efficient in the delivery of packages than horses. The motive power of these horseless wagons will be the petroleum engine, and they will be constructed on the pattern of those which recently carried off the prize in the race from Bordeaux to Paris. It is claimed that these engines can do the work of one horse at a cost of only one cent an hour. What with electric and petroleum motors the emancipation of the horse as a draft animal is rapidly approaching, and it is not out of the bounds of possibility to assert that the iron horse itself will soon be gathering rust. It is to be regretted that the pavements will not permit the introduction of storage battery wagons into this service.

## TRADE NEWS.

The American Carbon company has removed its offices from Dayton, O., to Noblesville, Ind.

J. S. Parker, who has been connected with R. B. Corey as general accountant, has accepted a position with the Standard Thermometer company of New York, in the arc lamp department.

The New England Butt company of Providence, R. I., reports new work on hand and future orders which show a large increase in business over last year, and indications are favorable for a good trade on the company's braiding apparatus, used in the manufacture of covered wire.

The Metropolitan Electric company, 186–188 Fifth avenue, Chicago, is not complaining about slow business, the sales having multiplied this year three times the amount shown at the same period last year. The company is young in age, but a giant in strength and has entered upon an era of prosperity that is marvelous for these times. It handles some of the best known specialties on the market, among them P. & B. goods, N. I. R. rubber wire, Solar arc lamps, Metropolitan incandescent lamps and the portable hose bridge.

The Brush Electric company of Cleveland seems to be particularly fortunate in securing large orders for its apparatus in foreign countries. The new electric light station of Shanghai, China, will be the most complete and the largest on the continent of Asia. The city of Shanghai erects the station at its own expense. Shanghai has a population of about 280,000. Some idea of the size of the station can be gained from the fact that the buildings are very similar in size to the large new electric light station recently completed in Cleveland. In the city of Manila, Phillippine Islands, a city of about 300,000 people, a large new electric light station has just been completed, all the work being done by the Brush company of Cleveland.

The Phillips Insulated Wire company has been among the first to note the large increase in the covered wire trade. It has been working its force at the factory to the full extent, and is considering the advisability of adding to the factory building. This concern has been particularly fortunate when brought in competition with other manufacturers in the sales of "Ideal" wires and cables, and also the "O. K." brand during the past year. It claims the only authorized fiber covered wire for inside and tube work which will not deteriorate by long use, or oxidize the copper. From a small beginning, through the careful management of Treasurer H. O. Phillips, this company has grown to its present large proportions, and is to-day one of the best known manufacturers of covered wire. A large share of its production is sent to the central and western states.

## BUSINESS.

The Bryant Electric company has a specially designed K. W. cutout for switchboard work. It also makes a 10 ampere double pole cutout for 500 volts, covered with mica.

G. W. Conover, western manager of the Perkins Electric Switch Manufacturing company, reports that the demand for the Gibbs switches has grown so fast that the company has found it necessary to double its facilities for the manufacture of these wide and favorably known switches.

Royce & Marean, the large electric supply house on Pennsylvania avenue, Washington, D. C., reports business exceedingly good. They have just received a contract for a new dynamo to be placed in the Washington brewery and a contract for wiring the Metropolitan power house. More orders have been received for electric fans this season than they can fill.

One of the beneficent results of the World's Fair, from an electrical point of view, was the impetus given to the manufacture and sale of electric launches. The Electric Launch company of Morris Heights, New York city, has taken advantage of this opportunity and fills a promising field worthily and acceptably. The company is prepared to furnish all kinds of electric boats, from open skiffs for hunting and fishing to elaborately fitted cruising yachts. Interesting details and pleasing illustrations are furnished in a handsome little book, "Electric Launches," which the company has just issued. All interested in boating should obtain a copy.

Central station and electric power managers will be interested in hearing of what would seem to be a record breaker for quick shipment of a large belting order by the Jewell Belting company of Hartford, Conn. An order was received by that company from Rochester, N. Y., for a three-ply belt, 72 inches wide and 118 feet long. In 19 hours and 20 minutes after the receipt of this order, it was on the wagon ready for shipment. Taking into consideration that the leather for the manufacture of this belt was taken from stock, and that the full guarantee of this company was sent with it, this feat is another demonstration of the fact that although the Jewell Belting company is, with few exceptions, the oldest concern in its line, it has kept fully abreast of the times.

The Electric Appliance company is general selling agent for the Russell automatic switch, having just closed exclusive arrangements. By means of this device a light or group of lights can be controlled independently from any number of points without any additional electric light wiring. The Russell switch is usually placed in the cutout box and a single circuit run to the light or group of lights

to be controlled. From the switch circuits of No. 18 wire are run to the points from which the lights are to be controlled, where an ordinary gas key does the work. Pressing the white button results in turning on the lights and pressing the black button turns them off. The Russell devices are now approved by the National Board of Fire Underwriters and will undoubtedly meet a large sale.

A paper box make after the fashion of an egg crate, to hold twenty lamps, is the unique production of General Manager J. J. Gates, of the Perkins Electric Switch Manufacturing company of Hartford, Conn. A representative of the WESTERN ELECTRICIAN saw one of these boxes filled with incandescent lamps thrown down two flights of stairs, and, when opened, there was no breakage. This box is made after a special design and is peculiarly adapted for its purpose, and will fill a requirement of hardware merchants, who are beginning to carry a stock of incandescent lamps in many cities. These merchants can now have their lamps placed upon the shelves of their stores in a compact manner. This company is rapidly increasing the facilities for the manufacture of incandescent lamps, by additional help and apparatus, but the demand has been so large that the present capacity has been taxed to fill orders promptly.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued June 18, 1895.*

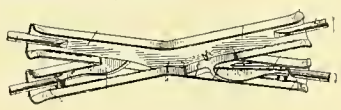
541,073. Electric Car Brake. George B. Damon, Lowell, Mass. Application filed April 30, 1894.

A double controlling stand carries two systems of contacts, one adapted to control the supply of current to the car propelling motors, and the other adapted to control the supply of current for a shunt circuit. A cylinder, a piston reciprocating therein, a brake shoe attached to the rod of the piston, a spring adapted to press the brake shoe away from the wheel of the truck, and a valve inserted in the pipe, through which pneumatic pressure enters the cylinder from the source of pneumatic pressure, and governed by electrical devices through which the shunt circuit governed by the controlling stand passes, are also features of the invention.

541,077. Telephone System. William W. Dean, St. Louis, Mo. Application filed February 21, 1895.

The combination comprises a local transmitter circuit, including two parallel branches, two induction coils having their primaries included one in each of the branches of the transmitter circuit, and their secondaries included in the telephone line in series, a microphone included in the transmitter circuit, and a battery adapted to direct current through the branches in parallel.

541,081. Storage Battery and Method of Making Same. Nathan H. Edgerton, West Whiteland, Pa. Application filed February 27, 1894.



NO. 541,098.

A series of cells is arranged, with intervening conducting partitions and surrounding non-conducting frames molded thereon, the cells filled with a permeable material, charged with an electrolytic fluid, and the terminal partitions having conductors connected therewith, in combination with an envelope of plastic non-conducting material in an inclosing case adapted to retain the gaseous elements evolved in the charging and discharging of electric currents through the series of cells.

541,098. Crossing for Trolley Wires. John Kroger, Pleasantville, N. J. Application filed November 3, 1894.

There is a central depression, and portions of the grooves are cut away; locks or guards are hinged or otherwise set in the cut-away portions of the grooves, and adapted to be raised by the passage of a trolley, as shown in the cut.

541,121. Device for Conducting Electricity to Lamps, etc. George F. Rose, London, Eng. Application filed February 27, 1895.

The cut shows a fixture for electric lighting on dining tables, sideboards or other analogous places, in which flat conducting strips and contact devices, consisting of spikes and metal brushes or webs for connecting the lamps thereto, are utilized,

541,136. Rheostat or Other Circuit Controller. Charles Willms, Baltimore, Md. Application filed November 26, 1894.

A feature of the invention is the combination of a series of contacts, and a spring pressed contact piece, one member being movable relatively to the other for making contact between the contact piece and the different contacts, the contact piece having an edge by which the contact is made.

541,146. Electrolytic Process and Apparatus. Henry Blackman, New York, N. Y. Application filed July 2, 1894.

The improvement in electrolytic processes described consists in first cooling the electrolyte, then introducing it to the cell, and then subjecting it to electrolysis and again cooling it during the electrolysis.

541,147. Process of and Apparatus for Bleaching. Henry Blackman, New York, N. Y. Application filed June 28, 1894.

This process consists in first electrolyzing a solution of a chloride of an alkali or alkaline earth, heating the electrolyte containing the resulting hypochlorite and bleaching with it while at an elevated temperature, then cooling it and again electrolyzing it, whereby the bleaching is performed at a high temperature and the electrolysis at a low temperature.

541,148. Current Strength Indicator. Percival G. Burgess, Boston, Mass. Application filed March 25, 1895.

The first claim follows: In a current strength indicator the combination of an electro-magnet and armature, a mechanically actuated detaching mechanism for applying to said armature a steadily increasing force in opposition to the attraction of the magnet, an indicating device or pointer actuated by the said detaching mechanism, and a stopping or locking device controlled by the detachment of the said armature from the magnet poles, and operating at the moment of detachment to arrest and prevent the further movement of the said indicating device, whereby an approximate indication is obtained of the resistance offered by said magnet to the movement of the armature.

541,149. Transmitter, John Burry, New York, N. Y. Application filed October 23, 1893.

Among the features claimed is the combination of a rotary shaft, the switch thereon, the brushes bearing on the switch, the opposing electro-magnets, the armature between them, a source of electrical energy and electric conductors.

541,152. Distributing Frame for Telephone Circuit Conductors. Frank B. Cook, Chicago, Ill. Application filed January 9, 1895.

This is an appliance for transferring or interconnecting electric conductors, consisting of a support or plate, upon the front side of which parallel insulating blocks are secured at a suitable distance therefrom, the blocks having upon their upper and lower edges metal conductor terminals, from which conductors extend through the support to its rear side and there divide, all the conductors coming from the lower terminals extending in one direction, and all coming from the upper terminals extending in another direction.

541,165. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa. Application filed September 7, 1889.

The combination consists of the car body, the axles and wheels therefor, an electric motor having its shaft connected with the axle by a hinged frame, a power transmitting connection between the motor shaft and axle, and an elastic support for the motor, permitting it to rise and fall bodily while maintaining the transmitting connection with the axle.

541,179. Electric Arc Lamp. Charles A. Pfluger, Chicago, Ill. Application filed July 2, 1894.

In an arc lamp two carbon holders or tubes are arranged at an angle to each other with a controlling solenoid; the solenoid and the two tubes are pivotally connected together toward one end of such tubes, and the core of the solenoid and the tubes pivotally connected together at the other end of the tubes.

541,194. Electric Switch for Railways. Leonard Wheeler, Sioux City, Ia. Application filed June 8, 1894.

In an electric switch there is the combination with false rails or plates secured between the track rails, and possessing conductivity of current and insulated from track rails, and adapted to independently receive the current from the car, of electromagnets situated in a water-tight casing near the swinging rail, wires separately connecting the false rails and the electromagnets, so that the current may be connected with either of the magnets, an armature movably situated between the electro-magnets, a rod connecting the armature and the swinging rail, means for lengthening and shortening the rod, hard rubber packing for the rod to prevent too great concussion of the switch, and a water-tight casing for the rod.

541,200. Electric Elevator. Rudolf Eickemeyer, Yonkers, N. Y. Application filed October 1, 1890.

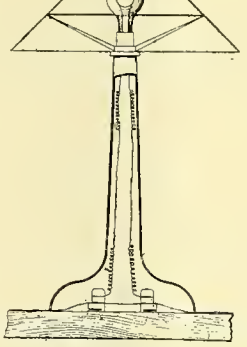
A shunt wound electric motor, an armature circuit supplied from generators and accumulators, and a resistance which is automatically adjustable to counter-electromotive force as it is developed in the motor, are features claimed.

541,225. Repeater. Moses G. Crane, Newton, Mass. Application filed August 4, 1894.

A controller for each circuit is adapted to respond to changes therein, a secondary motor controlled by the main motor, an independent locking device for each controller, adapted to move automatically to a predetermined position, and engaging portions of the locking device adapted to co-operate with the secondary motor and controller respectively.

541,227. Electric Switch. Chaimsonovitz P. Elieson, London, Eng. Application filed July 16, 1894.

This device is a circuit controlling switch, comprising among its members a receptacle composed of non-conducting material, supporting pivots therefor, engaging the receptacle adjacent to one end thereof extending within the same, and forming circuit terminals and a movable conducting body within the receptacle.



NO. 541,121.

541,233. System of Electrical Distribution. Charles K. Huguet, New Orleans, La. Application filed January 30, 1895.

This method of distributing alternating electric currents consists in passing a current of constant potential through a circuit, and maintaining the current at a constant volume by relative inductive action between the current on the constant potential circuit and the current on a separate constant current circuit.

541,287. Electric Stop Motion for Engines. Eugene C. Myrick and George C. Doeg, Providence, R. I. Application filed May 23, 1893.

The governor and the valve detaching mechanism in combination with mechanism for connecting the governor and the valve detaching mechanism is a prominent feature. The connecting mechanism is constructed in two parts, detachably connected together, and means for automatically disconnecting the parts of the connecting mechanism through an electric circuit by the abnormal movement of some part of the engine.

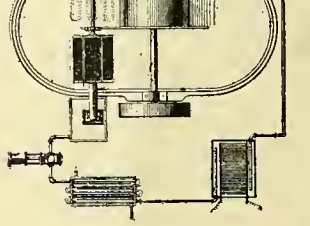
541,290. Arc Lighting. Samuel W. Rushmore, Brooklyn, N. Y. Application filed March 20, 1895.

In a circuit of four or more arc lamps in series the lamps are arranged in pairs, the feeding of one lamp of each pair being controlled or modified by a coil in shunt to its own arc and by a coil in shunt to the arc of the second lamp only of the pair.

541,332. Insulator. James M. Patterson, Springtown, Tex. Application filed April 10, 1895.

An insulator, comprising two sections of insulating material adapted to fit together, and each provided on its inner sides with a longitudinal recess, and blocks notched on their inner faces and adapted to be inserted in the longitudinal recesses in the sections, with their notches coinciding to form a passage for the wire.

541,338. Underground Closed Conduit System for Electric Railways. Adolph J. Smith, Milwaukee, Wis. Application filed June 6, 1894.



NO. 541,147.

In an underground conduit system for electric railways there is the combination with a conduit having one or more trolley chambers, of an independent conducting chamber and conducting wire located therein, insulated metallic shafts communicating at intervals from the conducting chamber to the trolley chamber, provided with a contact arm in the conducting chamber, adapted to be rocked into contact with the conducting wire, and an actuating arm in the trolley chamber, a reciprocating trolley track connected with the actuating arms and supported independently in the trolley chamber, and means for taking up the lost motion of the actuating arm when rocked by the reciprocal motion of the track.

541,341. Electric Alarm Signal and Indicator for Trolley Railroads. Jacques A. Buisson, New Orleans, La. Application filed April 2, 1895.

A main trolley wire or feeder and a short auxiliary wire extended parallel therewith and in the same horizontal plane are combined, and there are means for rigidly and mechanically connecting the two wires, the ends of the auxiliary wire being turned up to form upwardly inclined planes or shoes capable of readily receiving a trolley wheel, and a wire connected to one upturned end of the auxiliary wire, the connection being out of the plane in which the main portion of the auxiliary wire is located.

541,357. Compound Wound Alternating Generator. John D. Hilliard, Jr., Bluefield, W. Va. Application filed June 21, 1894.

One claim is given: The combination with the alternating current generator, the commutator arranged in a shunt circuit from the generator and in circuit with the series winding of the field of the generator, the variable resistance coil arranged in said shunt circuit, the armature actuated by the said coil, a latch held by the armature, and a circuit closer operated by the latch and adapted to short-circuit the coil.

541,365. Switch for Overhead Railways. Eugen Langen, Cologne, Germany. Application filed April 6, 1895.

A switch or point for two meeting lines of an overhead railway for suspended vehicles consists of a laterally movable triangular structure, two sides of which are curved to correspond with the curvature of the meeting lines of railway, so that when the switch is moved over into either position its one side lies against the outer rail of the one line of rails, while its other side forms a continuation of the inner rail of the other line of rails, meeting at its end the outer rail of the other line.

541,366. Switch for Overhead Railways. Eugen Langen, Cologne, Germany. Application filed April 6, 1895.

This includes a single tongue switch for two meeting lines of rails, which, being pivoted to the line at its base, and having its point formed with a separate piece pivoted thereto, lies close against the rail when moved over into either extreme position.

541,380. Armature for Electric Motors and Generators. James F. McLaughlin, Philadelphia, Pa. Application filed December 5, 1891.

The invention comprises an armature for electric motors and dynamo-electric generators, composed of a cylindrical iron body provided with troughs opening into the periphery, armature coils removably seated in the troughs, and an iron wire wrapping constituting a magnetic shield continuous both longitudinally and peripherally over the cylinder.

541,389. Electric Train Signal. Edward J. Devine, Port Arthur, Can. Application filed December 11, 1894.

A series of wires and a circuit closer are provided with a frame and a movable shield or tongue, the wires being extended into or mounted on the frame and tongue, one of them having an uninsulated portion, another of the wires also having an uninsulated portion extending across the plane of the former uninsulated portion.

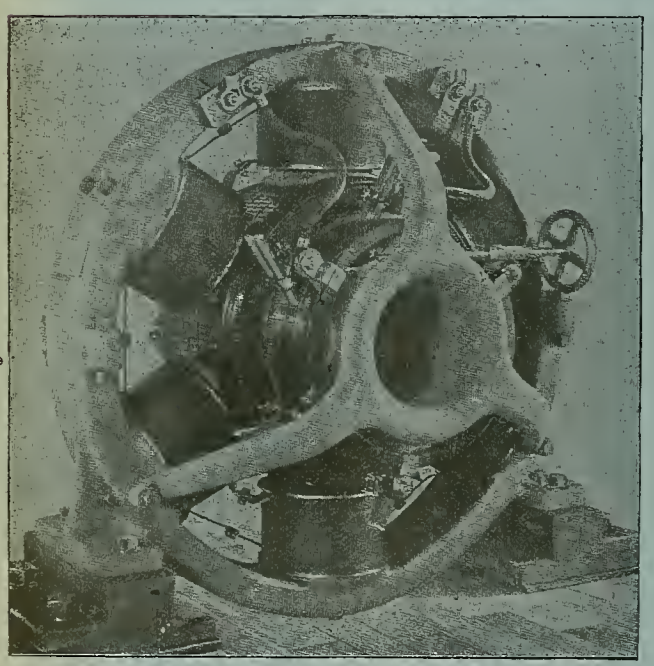
# DIRECT CONNECTED

# GENERATORS

FOR

# CENTRAL STATIONS or ISOLATED PLANTS.

The Standard Direct Current Lighting Generators of the World.



M. P. 6-50-275 WITH IRON-CLAD ARMATURE.

These machines are constructed to meet the most stringent requirements of electric lighting practice. In insulation, in workmanship and design their superiority is acknowledged. The frames and pole pieces are of cast steel, the armature windings of copper bars, the insulation most carefully applied, and the armature thoroughly ventilated. The commutators and brushes are perfect in their operation under all conditions of load, and the machines are sparkless. The largest lighting stations in the world have adopted direct connected generators of our make and the smaller sizes can be found in the majority of modern isolated plants.

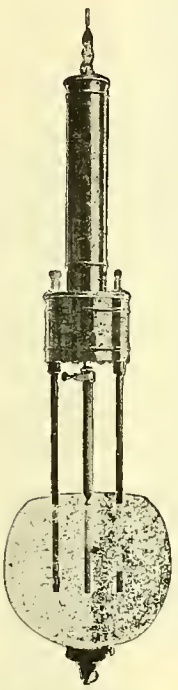
## New Alternating Arc Lamp

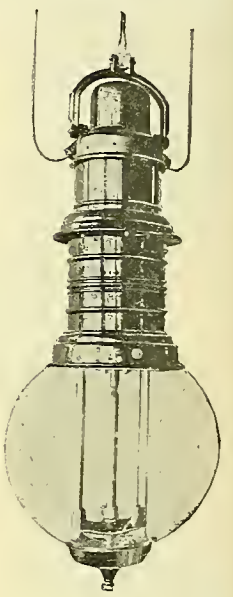
### For Street Lighting

No. 13.
Inside 7 Ampere 7 Hour Lamp.

New Alternating Lamp 900 c. p, 7 amperes at 28 volts or 4½ amperes at 50 volts, 2¼ amperes at 100 volts. It consumes the energy of 3½ 16 c. p. incandescent lamps. A small alternating lamp is only possible with a reflector plate.



We have just completed a new direct current lamp which we guarantee will not **SEE-SAW.** The mechanism is entirely novel. By means of this arrangement the most troublesome feature in running lamps in series is eliminated.



No. 10.
Street Lamp, either 12 or 14 hour, to be used in connection with Special 33 Volt Transformer.

*Low Potential Direct Current Lamps*

THE

# Chloride Accumulator.

The Electric Storage Battery Company has acquired all the patents and patent rights concerning the manufacture of electric storage batteries of the General Electric Company, the Edison Electric Light Company, the Thomson-Houston Electric Company, the Brush Electric Company, The Accumulator Company, The Consolidated Electric Storage Company and the General Electric Launch Company, whereby The Electric Storage Battery Company has secured to itself the sole right to supply in the United States electric storage batteries of all the various important types heretofore developed, as well as the protection of every decision heretofore rendered by the United States courts in the interpretation of electric storage battery patents.

The acquisition of these patents not only terminates all litigation heretofore existing, but insures the company against any future attacks, as the patents acquired, together with those originally owned by The Electric Storage Battery Company, cover all the known principles involved in storage batteries.

The Company has also increased largely its cash working capital, and is fully prepared to fill all orders for storage batteries promptly.

Catalogue containing full description of the various types of elements, weights, capacities, dimensions, etc., and price list, furnished on application.

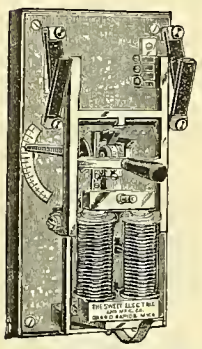
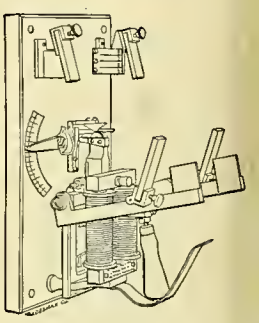
# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

**WE KNOW YOU NEED OUR CIRCUIT BREAKER,** and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



**WRITE US AT ONCE.**

# WHEN YOU ADVERTISE A MAN

IT'S FOR A PURPOSE.

**NOTICE TO THE TRADE.**

We beg to announce that Mr. James W. Godfrey is no longer in our employ.

New York Insulated Wire Co.,
December 8, 1894. 15 Cortlandt St., N. Y.

Above TRUE; but it's a clear, honorable and successful record as general manager in developing their business to its present condition.

---

## TO THE TRADE.

December 22, 1894.

I beg to announce that I have arranged with the INDIA RUBBER AND GUTTA-PERCHA INSULATING CO., manufactnrers of the celebrated Habirshaw White Core Insulated Wires, Cables, etc., and shall hereafter manage the sales department of the Company.

Messrs. F. W. Harrington and J. B. Olsen, will be connected with the above Company, January 1st, and we are now prepared to make prompt deliveries on all orders for Habirshaw's high grade Insulated Wire, Cables, Etc.

Soliciting a continuance of your esteemed favors, I am,

Yours obediently, J. W. GODFREY,
Room 52, 18 Cortlandt Street, New York City.

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

THE

# "CLARK" WIRE.

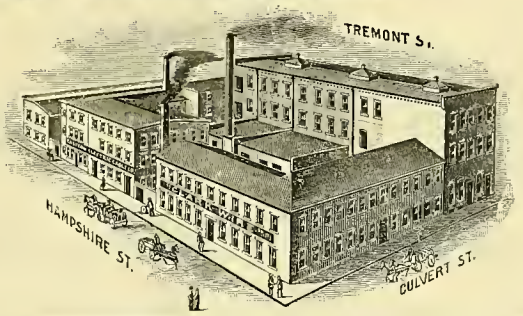
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2,000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

The "CLIMAX" STEAM BOILER

Three Boilers Sold Chicago Edison Co.

The Only Boiler Tested at the World's Columbian Exposition.

The only NON-EXPLOSIVE boiler made.
Will save you money on coal.
Built in units from 50 to 1500 H. P.

MANUFACTURED BY

Clonbrock Steam Boiler Works,

Grinnell and Court Sts., BROOKLYN, N. Y.

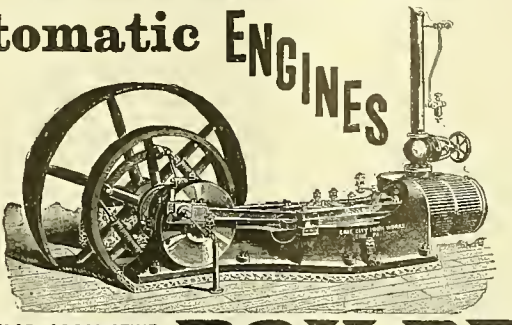
Send for new Catalogue.

ERIE CITY IRON WORKS,

INCORPORATED.

Manufacturers of HIGH and MEDIUM SPEED

Automatic ENGINES



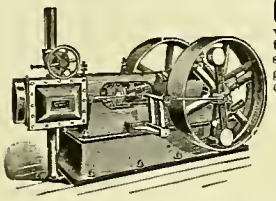
and

RETURN TUBULAR, LOCOMOTIVE AND VERTICAL BOILERS.

1510 OLD COLONY BLDG., CHICAGO.

J. H. McEWEN MFG. CO.,

Automatic Engines, both Vertical and Horizontal, from 12 to 600 h. p.



OUR GUARANTEE: The engine shall not run one revolution slower when fully loaded than when running empty, and a reduction of boiler pressure from the greatest to that necessary to do the work, will not reduce the speed of engine one revolution. Any engine failing to meet this guarantee becomes the property of the purchaser upon payment of one dollar.

It is one of the Most Economical Engines on the Market.

# The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of oo and oooo copper rod.

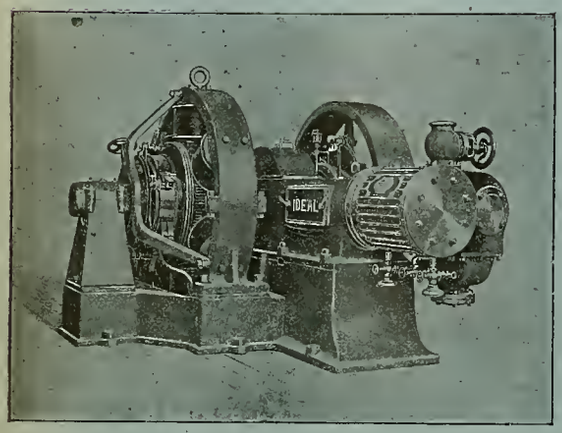
# DIRECT CONNECTED

# GENERATORS



FOR

## CENTRAL STATIONS OR ISOLATED PLANTS.

The Standard Direct Current Lighting Generators of the World.

**These machines are constructed to meet the most stringent requirements of electric lighting practice and are the most efficient before the public. In insulation, in workmanship and design their superiority is acknowledged. The frames and pole pieces are of cast steel, the armature windings of copper bars, the insulation most carefully applied, and the armature thoroughly ventilated. The commutators and brushes are perfect in their operation under all conditions of load, and the machines are sparkless. The largest lighting stations in the world have adopted direct connected generators of our make and the smaller sizes are found in the majority of modern isolated plants.**

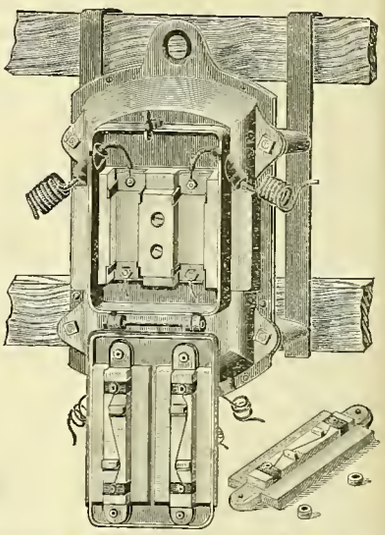
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

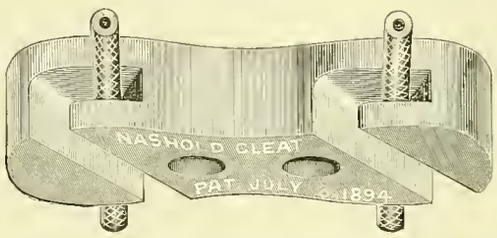
FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

Chicago Office, 1307 Manhattan Building, Central Electric Co., Selling Agents.

# NASHOLD
# Self-Locking Cleat.

PATENTED IN U. S., CANADA, ENGLAND, FRANCE, AND APPLIED FOR IN GERMANY.



**IT IS THE MOST PRACTICAL CLEAT MADE.**
**IT IS MADE OF FINEST GLAZED PORCELAIN.**
**IT IS IN ONE PIECE.**
**IT HAS THE STRENGTH.**
**IT WILL LOCK THE WIRE FIRMLY.**
**IT WILL NOT BREAK IN PUTTING UP.**
**IT WILL NOT HOLD MOISTURE.**
**IT WILL NOT HURT THE INSULATION.**

The wire can easily be put in place or removed without loosening the Cleat. It is a great saver in Time and Labor over any other Cleat in use for putting up Electric Light or other Wires.

FOR SALE BY ALL ELECTRICAL SUPPLY HOUSES.

## The Nashold Cleat Company,

934-935 MONADNOCK BUILDING,

Telephone, Harrison 636. CHICAGO, ILL.

## Alternating Current ARC LAMPS.

# The Kester '95

**IS THE LAMP YOU HAVE HOPED FOR.**

It is the only perfected Arc Lamp for the alternator, either high or low frequency.

It comprises all that is desired in an Arc Lamp.

Write for pamphlet and prices to

## Electrical Construction & Supply Company,

**135 SENECA STREET,**

**BUFFALO, N. Y.**

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

*NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.*

## THE WASHINGTON CARBON COMPANY, - PITTSBURG, PA.

The most Powerful Receiver Known.—Patented May 29, 1894.

"NATIONAL" COMPOUND RECEIVER.

# The "NATIONAL."

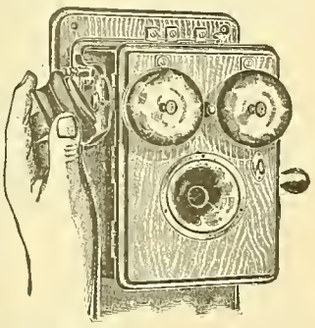
We make simply a business proposition. Buy two sets of our instruments and make your own tests. If satisfactory the way is open for more business, either in telephones or switchboards for exchanges.

Our head telephones are largely used by Bell telephone operators.
The "NATIONAL" is in use at the U. S. Military Academy, West Point, N. Y.

## NATIONAL TELEPHONE MFG. CO.,

620 (W) Atlantic Avenue, Boston, Mass.

"NATIONAL."
Method of Placing Receiver in Holder.



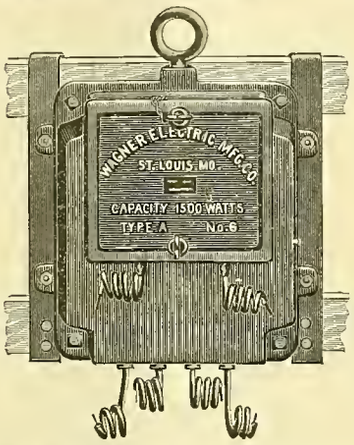
# ALTERNATING CURRENT TRANSFORMERS

Highest Efficiency Ever Obtained.

## TRANSFORMERS

To order for any purpose, voltage or capacity.

## ALTERNATING CURRENT MOTORS.



Standard Sizes, 5 Lights to 2,000 Lights.

## HIGH POTENTIAL SWITCHES,

Complete Switch Boards

For Central Stations and Isolated Plants.

Electrician Publishing Company,

6 Lakeside Building, Chicago.

# THE S. K. C. SYSTEM OF
# Two-Phase Alternating Current Apparatus.

*The first and only complete and perfected system by which light and power can be supplied from the same generator. Power transmission and distribution made practical and commercially successful.*

In construction and operation the entire system is much more simple than any other, either direct or alternating.

The superior efficiency of the generator is in itself a handsome profit to any station.

It is practically self-regulating without the loss of energy involved by compounding or compensating.

The usual sources of trouble and expense have been entirely eliminated from this generator; *i. e.* the revolving armature, commutators, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to 5,000 for power transmission work.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in the uniformity of speed under the different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

"No practical station man who has seen a Stanley alternator in operation will ever be satisfied with any other."

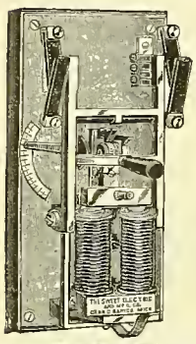
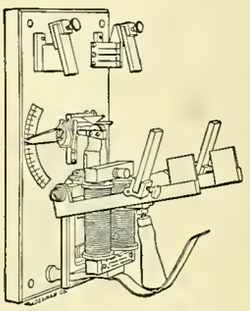
{ CLEVELAND, Cuyahoga Building. PHILADELPHIA, 633 Arch St.

# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

**WE KNOW YOU NEED OUR CIRCUIT BREAKER**, and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



**WRITE US AT ONCE.**

## SWEET ELECTRIC & MFG. CO.,

GRAND RAPIDS, MICH.

# The New "BERGMANN" Arc Lamps

**For Constant Potential Circuits.**

BETTER THAN ALL OTHERS BECAUSE

**They have No Adjusting Springs and No Escapements and Consequently can Not Get Out of Adjustment or Flicker or Stick.**

—X—

CHAS. A. CAVAGNA, Neave Building, Cincinnati, Ohio, Central States Sales Department.

# "THE PURE STUFF"

We hope you may get an idea from the above illustration. The point we want to bring out is that

## PARANITE INSULATION

Has its beginning in the Para Forests of Brazil, and not in the Rubber Shoe Industry.

## THIS MEANS

That we are giving you a compound with an insulation resistance away above any of its competitors, and a wire that will be doing perfect service when other compounds have "fallen down."

We know that it is easy enough to make claims of this kind, but

## DO NOT TAKE OUR WORD

for it. If you are a user of high grade wire in any quantity, determine these points for yourself and get the information first hand. Get samples, all having the same insulation diameter, of the rubber covered wires on the market, make a comparative test, and

## SEE WHERE PARANITE STANDS.

THEN WRITE US FOR PRICES.

THE

# "CLARK" WIRE.

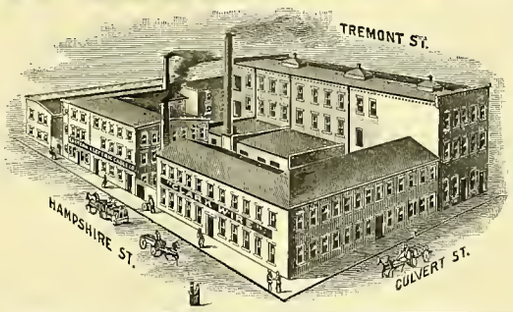
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.

TRADE MARK.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

### NORTH STAR POINTS

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

## Continuous Current Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turntables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current: Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction: Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V: Transformers, Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Piecing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

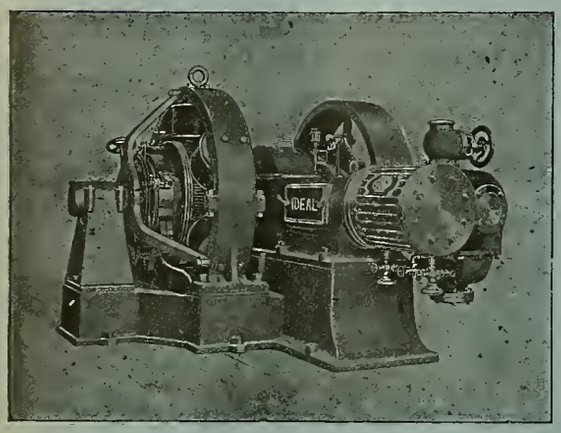
# DIRECT CONNECTED

# GENERATORS

FOR



## CENTRAL STATIONS OR ISOLATED PLANTS.

The Standard Direct Current Lighting Generators of the World.

**These machines are constructed to meet the most stringent requirements of electric lighting practice and are the most efficient before the public. In insulation, in workmanship and design their superiority is acknowledged. The frames and pole pieces are of cast steel, the armature windings of copper bars, the insulation most carefully applied, and the armature thoroughly ventilated. The commutators and brushes are perfect in their operation under all conditions of load, and the machines are sparkless. The largest lighting stations in the world have adopted direct connected generators of our make and the smaller sizes are found in the majority of modern isolated plants.**

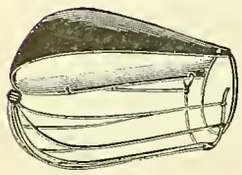
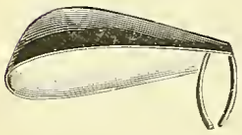
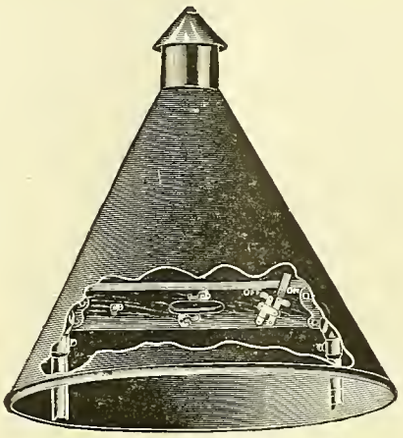
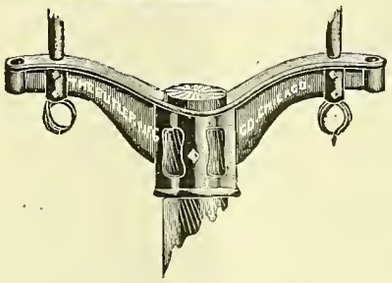
# THE BUTLER MANUFACTURING CO.

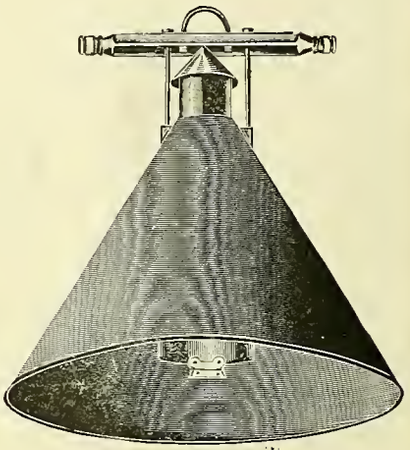
We manufacture the Best Line of Electric Lighting Specialties to be found anywhere. Here are a few that we aim to keep constantly in stock. Do you use them? Can you sell them?

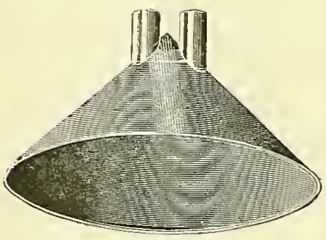


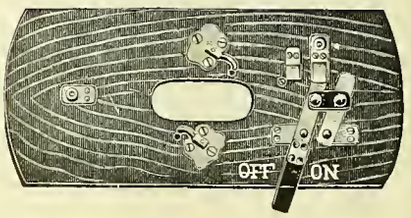


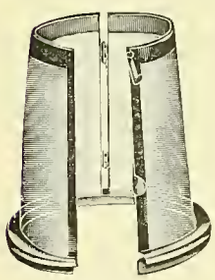


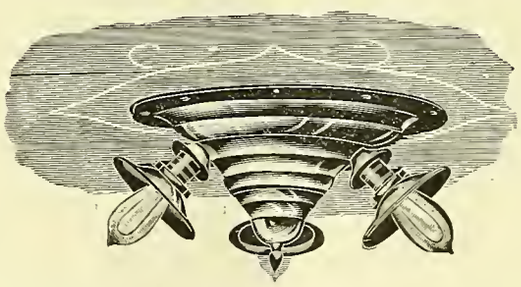


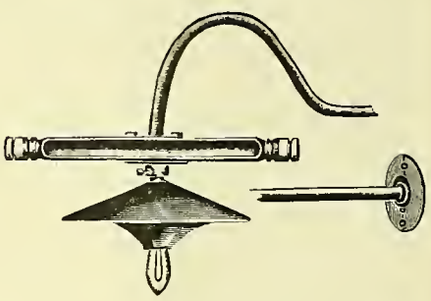


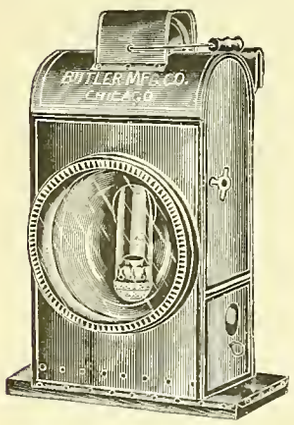


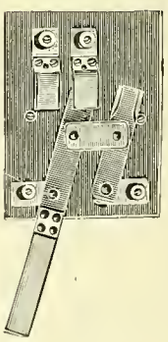


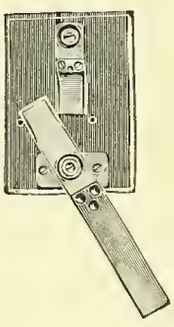


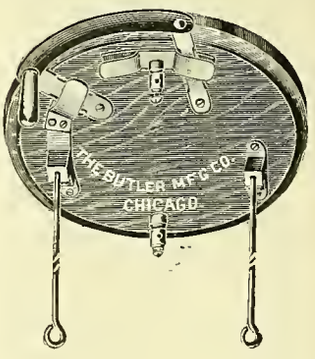












Send for our catalogue No. 894. It may interest you.

## The Butler Manufacturing Co., - Chicago.

# HAVE YOU SEEN IT?

# THE WAX WHEEL ARC LAMP.

*Without Magnets, Springs, Clutches or Escapements.*

## NEW AND ORIGINAL IN EVERY DETAIL.

"THE BEST LIGHTED TUNNEL IN THE WORLD."

An interior view of the largest single span tunnel in the world, used by the Halsted and Blue Island Avenue Cable Lines in passing under the Chicago River. This tunnel is lighted by fifty 2,000 candle-power Nutting Constant Potential Lamps. The photograph was taken from the light of the lamps in the tunnel.

## MADE FOR ALL TYPES OF CURRENT—

For Series Constant Current Circuits, Direct Current,
Constant Potential Circuits, " "
Alternating " "
Street Railway Circuits (500 volts).

SEND FOR A COPY OF "THE WAX WHEEL LAMP."

# NUTTING ELECTRIC COMPANY,

**128 and 130 South Clinton Street, CHICAGO, ILL.**

WM. H. McKINLOCK, President. W. C. McKINLOCK, Secretary.

# METROPOLITAN ELECTRIC COMPANY

## 186 AND 188 FIFTH AVENUE,

Cable address, "Insulation," Chicago. ***Chicago, Ill., U. S. A.***

WIRE AND CABLES.

Is absolutely the best.

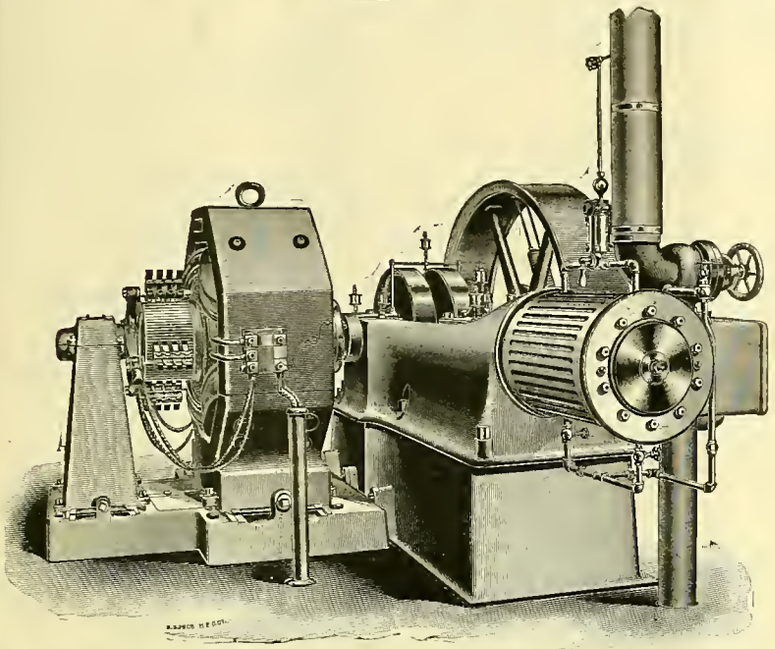
## Allen Soldering Stick,
## Electric Soldering Iron,
## Royal Transformer,
## Ries Regulating Socket,
## Edison-Lalande Batteries,
## Globe Carbons,
## Electric Cooking Untensils,

And a general line of Supplies.

**COMPLETE STOCK! LOW PRICES! PROMPT SHIPMENTS!**

# "MAC" TAPE.

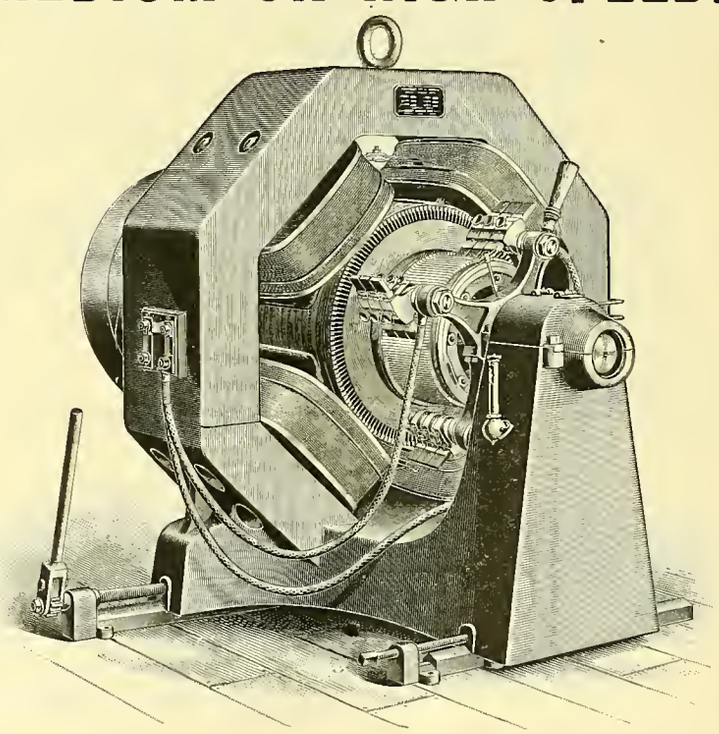
# Eddy Generators



DIRECT CONNECTED OR BELTED
FOR
ELECTRIC RAILWAYS,
CENTRAL STATIONS,
ISOLATED LIGHTING
OR
POWER PLANTS.

## EDDY MOTORS—SLOW, MEDIUM OR HIGH SPEED.

We build all necessary apparatus for the transmission of Electrical Power through factory or other buildings.



## All Our Apparatus Guaranteed As Represented.

## The Eddy Electric Manufacturing Company,

NEW YORK OFFICE,
HAVEMEYER BUILDING.

WINDSOR, CONN.

REPRESENTED BY:

Walter C. McIntire & Co., 506 Commerce St., Philadelphia.
Western Electrical Supply Company, St. Louis, Mo.
F. P. Little Electrical Construction & Supply Co., Buffalo, N. Y.
W. T. Osborn, Kansas City, Mo.

# THE C & C ELECTRIC COMPANY

MANUFACTURERS OF

## MULTIPOLAR DYNAMOS, BIPOLAR DYNAMOS,

Direct Driven or Belted, in sizes up to 250 H. P. Up to 100 H. P.

Electric Motors, Automatic or Hand Controlled.
Complete Plants for Power Transmission.
Isolated lighting plants, Central Station Apparatus.

General Office:
143 Liberty Street, NEW YORK.

Works: CARWOOD, N. J.
on CENTRAL R. R. of N. J.

BRANCH OFFICES: CHICAGO, 1020 and 1021 Monadnock Building. BOSTON, 63 Oliver St. CLEVELAND, Cuyahoga Building. PHILADELPHIA, 633 Arch St.

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

FOR STREET, PAVEMENT AND INSIDE LIGHTING.

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

## HELIOS ELECTRIC COMPANY,

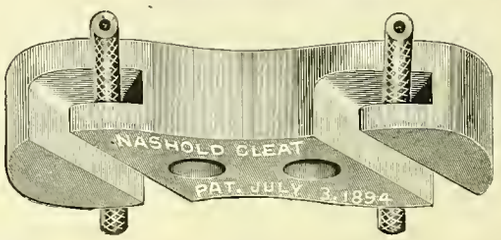
1310 Filbert St., PHILADELPHIA, PA.

AGENTS:

Eastern Agents: STANLEY ELECTRIC MFG. CO., Pittsfield, Mass.
Western Agents: CENTRAL ELECTRIC CO., Chicago, Ill.
Southwestern Agents: ST. LOUIS ELECTRICAL SUPPLY CO., St. Louis, Mo.
New York City Agents: GLOBE ELECTRICAL SUPPLY & CONSTRUCTION CO., Vandam and Greenwich Streets.
MOUNTAIN ELECTRIC CO., Denver, Col., Agents for Colorado, Utah, Wyoming and New Mexico.
MACHINERY SUPPLY CO., Los Angeles, Cal., Agents for Lower California and Arizona.
CANADIAN GENERAL ELECTRIC CO., Toronto, Canada, Agents for Canada.
Agent for Texas: W. T. M. MOTTRAM, Dallas, Texas.

# NASHOLD
# Self-Locking Cleat.

PATENTED IN U. S., CANADA, ENGLAND, FRANCE, AND APPLIED FOR IN GERMANY.



IT IS THE MOST PRACTICAL CLEAT MADE.
IT IS MADE OF FINEST GLAZED PORCELAIN.
IT IS IN ONE PIECE.
IT HAS THE STRENGTH.
IT WILL LOCK THE WIRE FIRMLY.
IT WILL NOT BREAK IN PUTTING UP.
IT WILL NOT HOLD MOISTURE.
IT WILL NOT HURT THE INSULATION.

The wire can easily be put in place or removed without loosening the Cleat. It is a great saver in Time and Labor over any other Cleat in use for putting up Electric Light or other Wires.

FOR SALE BY ALL ELECTRICAL SUPPLY HOUSES.

## The Nashold Cleat Company,

934-935 MONADNOCK BUILDING,
Telephone, Harrison 636. CHICAGO, ILL.

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

*NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.*

# THE WASHINGTON CARBON COMPANY, - PITTSBURG, PA.

ORIGINALITY. SIMPLICITY. DURABILITY. RELIABILITY.

PROCTOR-RAYMOND ELECTRIC CO.

MANUFACTURERS OF ELECTRICAL SPECIALTIES & SUPPLIES

**ROCHESTER, N. Y.**

Remember our Motto: The very best goods at the very lowest prices.

WHY PAY RENT?

# THE COLUMBIA

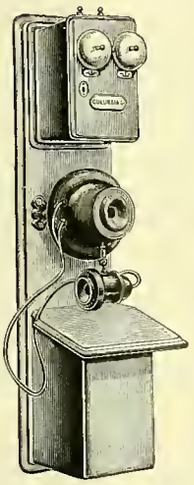
THE LATEST AND BEST.

PATENTS FUNDAMENTAL—NON-INFRINGING.

## Why Not Own Your Telephone?

**LONG DISTANCE BATTERY TRANSMITTERS**

of the latest and newest designs sold outright. No adjustment. Nothing to get out of order. Nothing demanding repair. Will convey articulate speech 1,000 miles. Constructed of the best material.



**A TELEPHONE RECEIVER**

of the newest and best pattern. Unique in design. Perfect in action. Moderate in cost. Small instruments made of the finest rubber. All wires and connections within the case. No unsightly thumbscrews.

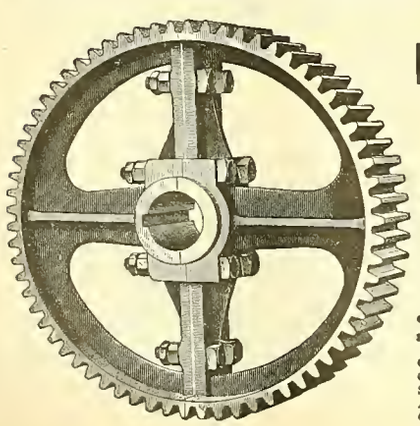
This Company owns the patent for the improved Switch for changing the circuit of the Telephone on battery transmitters. Also for perfected system of telephone exchanges. The best DRY BATTERY manufactured. Send for Circular.

# THE COLUMBIA TELEPHONE MANUFACTURING CO.,

**136, 138, 140 Front St., New York City.**

# R. D. NUTTALL COMPANY, Allegheny, Pa.

F. A. ESTEP, President and Treasurer.
J. R. McGINLEY, Vice-President.
F. S. MARTIN, Superintendent of Works.



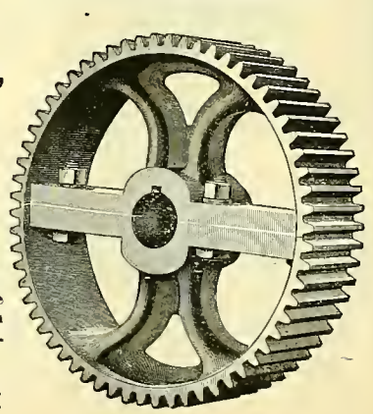
MANUFACTURERS OF

## Electric Railway Supplies.

**GEARS, PINIONS, BEARINGS, TROLLEYS, TROLLEY WHEELS AND HARPS.**

THIS IS THE IMPROVED NUTTALL TROLLEY.

TRY IT ONCE, AND YOU WILL WANT NO OTHER.



**The largest and most prosperous street railway companies in the country are using our supplies, and they prefer them to all others on account of greater strength and durability. Correspondence solicited.**

CHAS. J. MAYER, 600 Betz Building, Philadelphia, Pa., Middle States Sales Department.
CHAS. N. WOOD, 180 Summer St., Boston, Mass., New England States Sales Department.
STANDARD R'Y SUPPLY CO., Mooredock Block, Chicago, Ill., N. W. States Sales Department.
A. S. PARTRIDGE, Bank of Commerce Building, St. Louis, Mo., S. W. States Sales Department.
CHAS. A. CAVAGNA, Neave Building, Cincinnati, Ohio, Central States Sales Department.

C. G. PERKINS, President.

FREDERICK W. DAVIS, Secretary.

# The Perkins Electric Switch Manufacturing Co.

**WE MANUFACTURE**

THE "WATERHOUSE"
Incandescent Arc Lamp.

THE GIBBS
Snap Switches.

THE PERKINS
Sockets and Receptacles.

THE PERKINS
Dovetail Ceiling Cut-Out.

The "WATERHOUSE, GAMBLE & CO." Arc Lamp is always taken where sale depends upon competitive test. Why?

The "GIBBS" Switch only needs a trial to convince the most skeptical that it is the most durable, simple and efficient Switch in the market.

The "PERKINS" Sockets and Receptacles have been in the market three years on their merits. They are still being sold.

The Dovetail Ceiling Cut-Out speaks for itself.

**OUR PRICES HIGH? NO!**

**NOTE: Full stock of these goods carried in Chicago.**

STRATTON

THE

# "CLARK" WIRE.

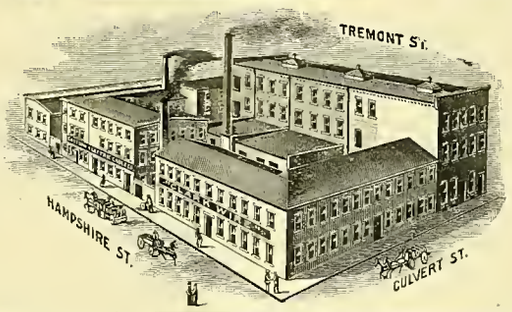
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalognes with Terms and Discounts for Quantities.

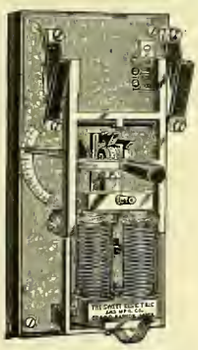
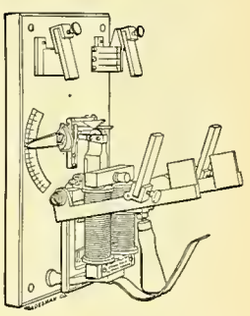
# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

**WE KNOW YOU NEED OUR CIRCUIT BREAKER,** and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



**WRITE US AT ONCE.**

# SWEET ELECTRIC & MFG. CO.,

# Analysis of Sal Ammoniac.

J. B. WEIS,
**Analytical and Consulting Chemist**
AND ASSAYER,
*Room 42, 87 Clark Street.*

☞Prices on application.

**Certificate of Analysis, No. 918.** Chicago, March 9, 1894.

**This Certifies** that I have analyzed sample of Sal Ammoniac, marked "A. G. Sal Ammoniac," submitted by Western Electric Company.

I find the amount of:

| | | | | | |
|---|---|---|---|---|---|
| Ammonium Chloride | contained | therein | to be | 99.51 | per cent. |
| Ammonium Sulphate | " | " | " | 0.03 | " |
| Moisture | " | " | " | 0.13 | " |
| Non-Volatile Matter | " | " | " | 0.02 | " |
| Organic Matter | " | " | " | 0.31 | " |

The Non-Volatile Matter consists of Iron Oxide and Alumina.

Signed, J. B. WEIS.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45 inch Wheel—July 9, 1894.

# JAMES LEFFEL WATER WHEELS

This Justly Celebrated Wheel is Built in Many Styles on

**UPRIGHT AND HORIZONTAL SHAFTS.**

It is SPECIALLY DESIGNED and ADAPTED for driving

## ELECTRIC LIGHTING AND POWER PLANTS.

Our new Wheel secures a remarkably **high guaranteed percentage**, and **wonderful steadiness** of motion, under variable loads in practice. It affords an **unequaled concentration** of power within a small space; and an **unprecedented high velocity** for a given power.

Its easily and **quickly** operated **balanced gate** affords prompt and **efficient** control by a governor, and consequent **fine regulation.** These wheels are in many instances operating the best electric plants in this and other countries, fully demonstrating their **remarkable adaptation** to that use.

The attention of Electric Engineers, and others contemplating water power improvements is directed to our work. We will send a fine large pamphlet, 112 pages, fully describing the wheel and various plans of application.

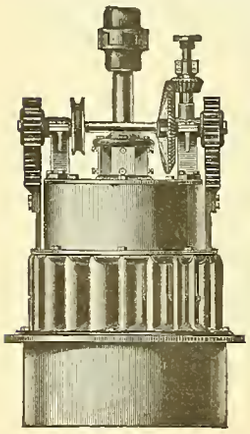
# New Dynamo Tenders' Hand-Book.

By F. B. BADT.

**226 Pages, 140 Illustrations. Flexible Cloth Binding. Size of Type Page 5 1-2x3 inches. Price $1.00.**

This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 9,000 copies of the old Dynamo Tenders' Hand-Book sold, and over 5,000 of the new.

**Electrician Publishing Co.,**
6 Lakeside Building, CHICAGO.



# THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

# ELECTRIC RAILWAY MOTORS.

Their Construction, Operation and Maintenance.

An elementary practical hand-book for those engaged in the management and operation of electric railway apparatus.

## With Rules and Instruction for Motormen.

By NELSON W. PERRY, E. M.

Price, Postage free, $1.00. PRACTICAL AND UP-TO-DATE.

TABLE OF CONTENTS.

I. Introduction.—II. Technical Terms, etc.—III. Ohm's Law; Rate of Work; Examples.—IV. Electric Current and Its properties.—V. The Electric Current and Its Properties (continued); The Solenoid.—VI. Measuring the Current; Magnetism and Electro-Magnetism.—VII. Lines of Force; The Closed Magnetic Circuit; Magnetic Leakage.—VIII. Polarity, Magnetism and Current.—IX. Electro-Magnetic Induction; The Continuous Current Dynamo; Increase of Electromotive Force; Eddy Current in Armature.—X. Shifting of the Armature Wires; Opened and Closed Coil Armatures.—XI. Drum and Ring Armatures; Consequent Poles and Multipolar Field Magnets.—XII. Multiple Arc and Series Arrangement; Current Characteristics of Multiple and Series Arrangements in Generators.—XIII. Current Characteristics in Translating Devices; Multipolar Fields.—XIV. The Dynamo Electric Principle; Series, Shunt and Compound Winding; The Reversibility of the Dynamo. XV. The Electric Motor.—XVI. The Electric Motor (continued) Torque.—XVII. The Line of Commutation; Counter Electromotive Force.—XVIII. Counter Electromotive Force and Speed Regulation; Requirements of Speed Regulation.—XIX. The Sperry and Johnson-Lundell Systems.—XX. The Leonard, Perry and Other Systems; The Perry System of Series Electric Traction; Storage Battery Traction; Conduit Systems.—XXI. The Management of Street Railway Motors; Sparking at the Commutator; Motor Stops or Fails to Start.—XXII. Specific Directions to Motormen.—XXIII. Instructions to Inspectors and Superintendents.—XXIV. Locating Faults; Commutators; Drop Method of Testing for Faults; Insulation Test; Bearings; Gears and Pinions; Controllers.—XXV. Trolley Wheels, Incandescent Lamps; Conclusion.

The Johnston
Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

John A. Roebling's Sons Co.,

New York. Chicago. San Francisco. TRENTON, N. J.

"H. W. J."
MECHANICAL CLIP.

An exceedingly simple and practical device consisting of a single casting—no parts to break or get out of order. Provides a straight underrun for and does not damage the trolley wheel. It holds the wire securely and is practically non-sparking. It is safe, economical and saves time.

Send for new and revised price list of

Trolley Line Insulating Materials.

## SIMPLEX INSULATED WIRES AND CABLES.

RUBBER COVERED, WEATHERPROOF, UNDERGROUND and SUBMARINE.

WESTERN SELLING AGENT. H. R. HIXSON, 1137 Monadnock Block, CHICAGO.

Simplex Electrical Company, 75-81 Cornhill, BOSTON, MASS.

## ANDERSON STEEL TROLLEY POLES AND HARPS.

PIVOTAL BOSTON TROLLEYS.

Received only Award for Trolleys at Chicago.

Manufactured by ALBERT & J. M. ANDERSON, 289-293 A St., Boston, Mass.

## GRAPHITE SPECIALTIES

FOR ELECTRICAL USES:

Graphite Rods of Various Lengths, from 1-5 Ohm to 100 Ohms Resistance to the inch. Graphite Boxes and Crucibles, Resisting Heats of 4,000 Degrees. Inquiries Gladly Answered.

JOS. DIXON CRUCIBLE CO., Jersey City, N. J.

## DRY BATTERIES.

BEST OF ALL IS THE STANDARD

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell. LIBERAL DISCOUNTS.

## INSULATED WIRES AND CABLES

DAYS STANDARD

Aerial, Underground and Submarine, for Telephone, Telegraph, Light and Power.

*KERITE TAPES.* Write for catalogues, samples and prices.

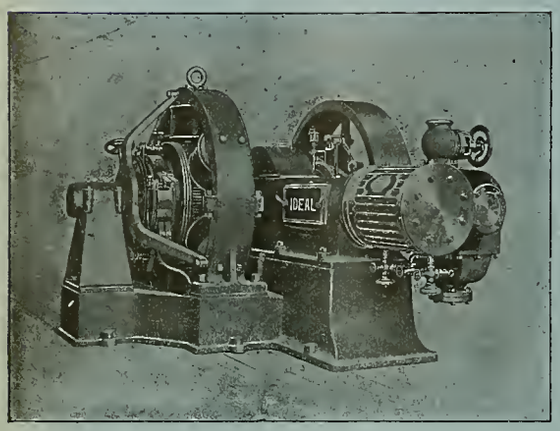
# DIRECT CONNECTED

# GENERATORS

FOR



## CENTRAL STATIONS OR ISOLATED PLANTS.

The Standard Direct Current Lighting Generators of the World.

**These machines are constructed to meet the most stringent requirements of electric lighting practice and are the most efficient before the public. In insulation, in workmanship and design their superiority is acknowledged. The frames and pole pieces are of cast steel, the armature windings of copper bars, the insulation most carefully applied, and the armature thoroughly ventilated. The commutators and brushes are perfect in their operation under all conditions of load, and the machines are sparkless. The largest lighting stations in the world have adopted direct connected generators of our make and the smaller sizes are found in the majority of modern isolated plants.**

## THE F. P. LITTLE Electrical Construction & Supply Company,

**135 SENECA STREET, BUFFALO, N. Y.**

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

***NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.***

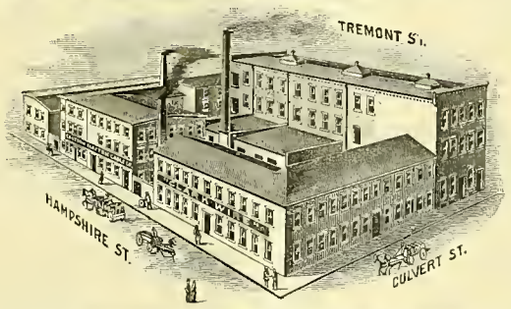
THE
# "CLARK" WIRE.

TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.
HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

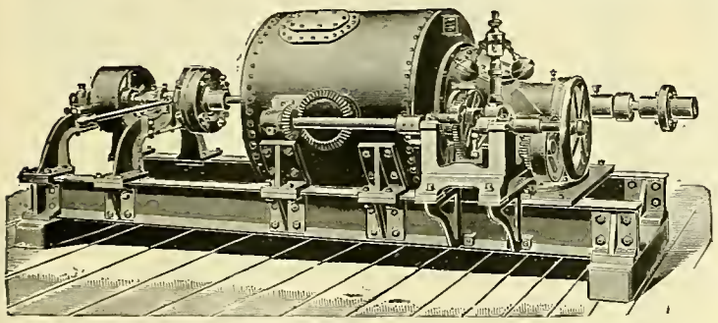
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double the power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

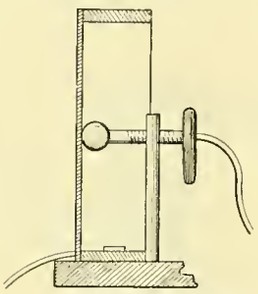

FIG. 44. BERLINER'S FIRST TRANSMITTER.

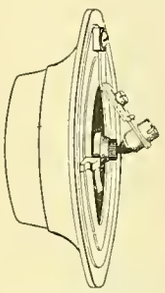

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickmeo, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current: Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constent Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Catch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTEB XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator —CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motor; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field: Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation —CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V; Transformers, Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses: Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments —CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

Orders for Above Books, or any other Electrical Works, Promptly Filled on Receipt of Price. Postage Prepaid.

## ELECTRICIAN PUBLISHING CO., 6 Lakeside Bldg., Chicago.

# POROUS --CUPS

EDGERTON POTTERY CO., EDGERTON, WIS.

Why not get the best?

1888. 1895.

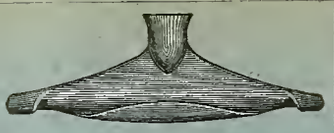
Give us trial order.

## The Wirt Dynamo Brush.

Suitable for all Incandescent Dynamos, Plating Dynamos, Alternating Generators and Exciters, Electric Railway Generators, Stationary Motors.

**WALLACE ELECTRIC CO.,**
307 Dearborn St., Chicago.

## "H. W. J." MECHANICAL CLIP.

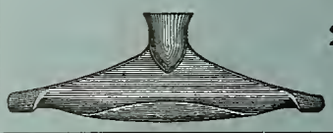


An exceedingly simple and practical device consisting of a single casting—no parts to break or get out of order. Provides a straight under-run for and does not damage the trolley wheel. It holds the wire securely and is practically non-sparking. It is safe, economical and saves time.

Send for new and revised price list of

Trolley Line Insulating Materials.

**H. W. JOHNS MFG. CO.,**



240 and 242 Randolph St.,
CHICAGO, ILL.
New York. Philadelphia. Boston.

## GARDNER DIE-STOCK

FULL THREAD AT ONE CUT.
ALL PARTS SUBJECT TO WEAR ARE CASE HARDENED.—ALL GUIDES OF HARDENED STEEL.
ADJUSTABLE DIES.
EXACT SIZE IRON AND 1/32° OVER SIZE IRON CUT WITH SAME DIE.
SEND FOR 250 PAGE ILLUSTRATED CATALOGUE

CH. BESLY & CO.
METAL WORKERS' TOOLS AND SUPPLIES.
10 & 12 N. CANAL ST. CHICAGO, ILL. U.S.A.

## FACTS:

ELECTRICALLY DRIVEN MACHINERY IS MODERN AND PROPER.
CROCKER-WHEELER APPARATUS IS THE BEST FOR THIS PURPOSE.
LIBERALLY PROPORTIONED, A GENEROUS FACTOR OF SAFETY AND ALWAYS EFFECTIVE IF YOU ALLOW US TO ADVISE YOU.

**CROCKER-WHEELER ELECTRIC CO.,** *MANUFACTURERS AND ELECTRICAL ENGINEERS,*
NEW YORK, CHICAGO, BOSTON, PHILADELPHIA.

## INCANDESCENT LAMPS.

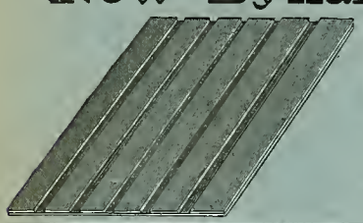
Manufactured by

# American Electric Mfg. Co.

WRITE FOR REDUCED PRICES.

2009 to 2017 Pine St., St. Louis, Mo.

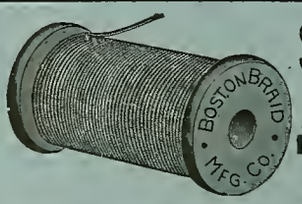
## New Dynamo Belting.



Patent Grooved Belting having Grooves running lengthwise of the Belt, serve as channels to permit the escape of air between Belt and Pulleys, to such a degree that the air cushion is overcome and the Belt can be ron very slack, thereby taking the heavy strain from the bearings.

**SHULTZ BELTING CO., St. Louis, Mo.**
Agents in all Principal Cities.

BRANCHES:
164 Summer Street, Boston.
225 Pearl Street, New York.
129 North 3d Street, Philadelphia.

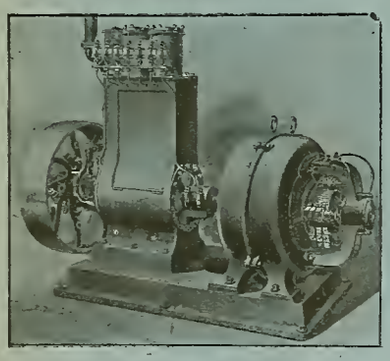


## SILK BRAID

For Incandescent Lamp Filaments.

The greatest care taken in producing a uniform article.

**BOSTON BRAID MFG. CO.,**
27 Beach Street, Boston, Mass.



## LUNDELL DYNAMOS AND MOTORS.

Direct Current, Slow Speed, Iron Clad,

In Sizes up to 30 Kilowatts.

Lundell Dynamos directly connected to any type of high speed engines.

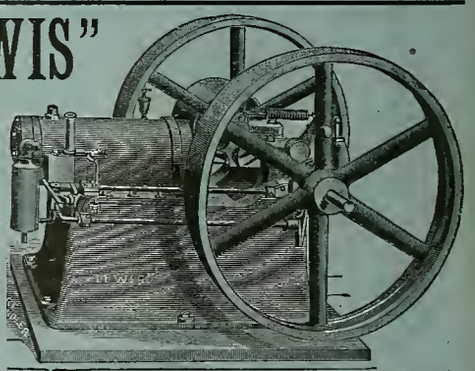
For Lundell Dynamo and Motor catalogues, prices, etc., address the

**Interior Conduit & Insulation Co.**
44 Broad St., N. Y.

## THE "LEWIS"

Improved Gas and Vapor Engine

For Running Isolated Electric Plants.

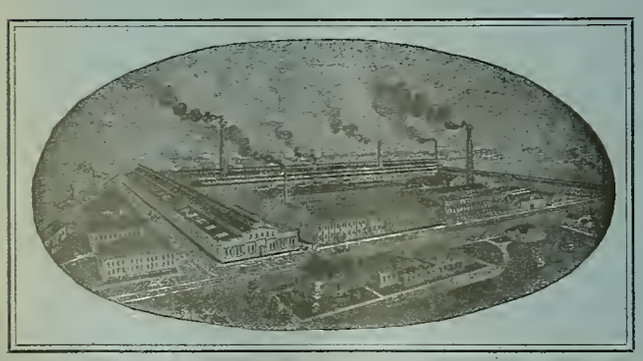


Is warranted to give a perfectly steady light, and to produce the same cheaper than gas and very much cheaper than if purchased from a central plant.

For prices and particulars inquire of the

**WEBSTER MFG. CO.,** 1075 West Fifteenth Street, CHICAGO.

Electric Lighting and Power Apparatus.



The Brush Double Arc Lamp Patents sustained by repeated decisions of U. S. Courts.

THE

# BRUSH

ELECTRIC CO.,

Agencies in all large cities.

Induction Motor.

A COMPLETE

# Light and Power

## Central Station

IN

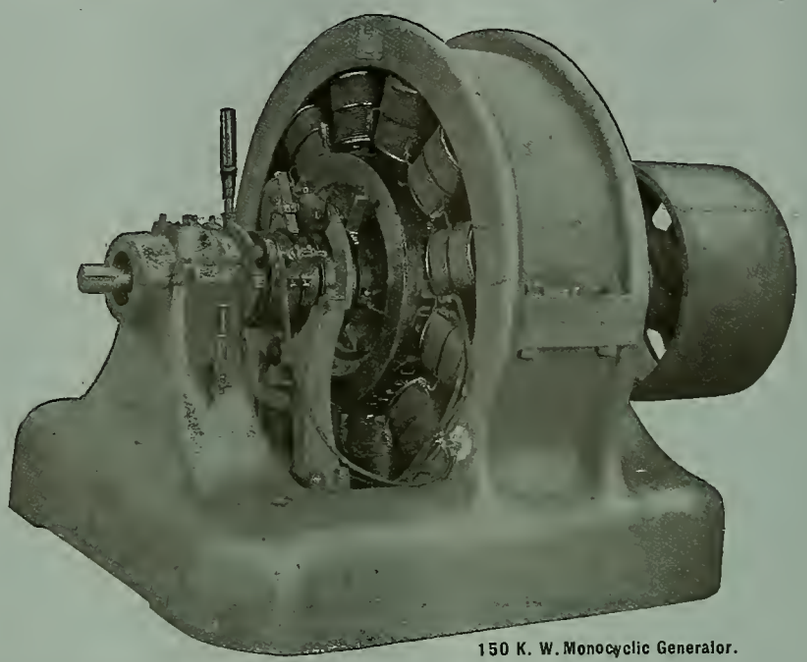
## A Single Alternating Generator,

Rendered for the first time possible by our

# MONOCYCLIC

Arc and Incandescent Lighting Circuits Operated on the Single Phase System as from the Ordinary Alternator.

Generators will carry full Load in Lights or Motors or any proportion in Lights and the rest in Motors. There can be no unbalancing.



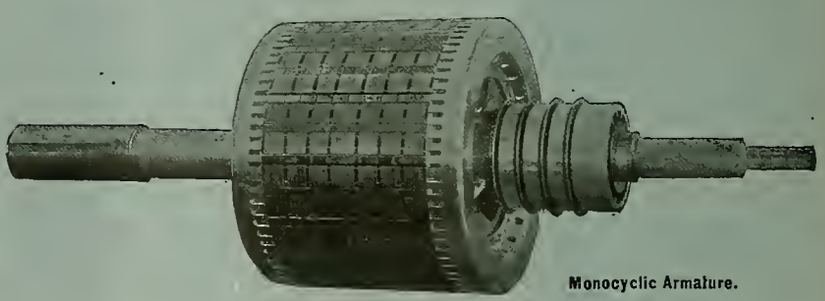
150 K. W. Monocyclic Generator.

Induction Motors Operated with Results Equal to those Obtained with the Best Direct Current Shunt Motors with the Same Efficiency and Better Speed Regulation.

May be Adapted to Systems of Secondary Mains Supplied from Large Transformers.

# SYSTEM OF

***For Power Purposes Equal to a Polyphase System. With all the Simplicity and Advantages of the Single Phase System.***



Monocyclic Armature.

# ELECTRICAL DISTRIBUTION.

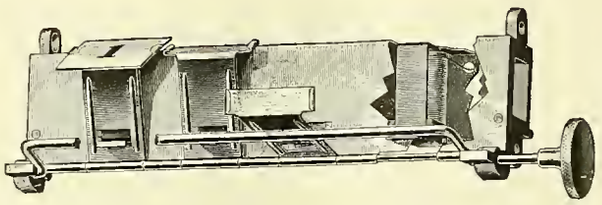
"A" STYLE.

Made in Sizes from 3 to 20 Drops.

# ANNUNCIATORS

That never fail to Annunciate.



This illustrates the inside construction of our Gravity Drop Annunciator as applied to the Eclipse Case.

No Springs. No Screws. Nothing to get out of adjustment. Simplicity itself.

*Our other Specialties:*

**REX** Wood-box Bells.

**ECLIPSE** Iron-box Bell.

## PROCTOR-RAYMOND ELECTRIC CO.,

Rochester, N. Y.

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

Direct Current Apparatus for Lighting Factories, Public Buildings and Isolated Plants.

Improved Long Distance Series Incandescent Apparatus for Street and Commercial Illumination.

Incandescent Lamps and Sockets for use on Arc Light Circuits.

**Correspondence Solicited.**

## THE UNITED ELECTRIC IMPROVEMENT CO.,

**19th St. and Alleghany Ave., Philadelphia, Pa.**

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

## A · Departure · In · Business · Methods!

*NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.*

## THE WASHINGTON CARBON COMPANY, - PITTSBURG, PA.

**HIGH POTENTIAL SWITCHES,**

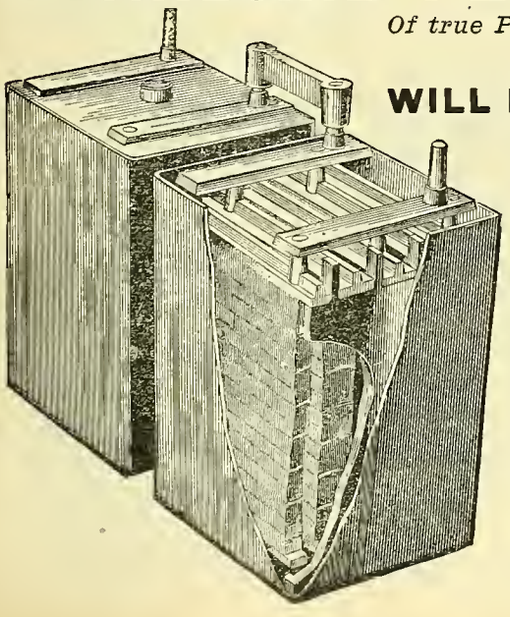
Complete Switch Boards

For Central Stations and Isolated Plants.

# WAGNER ELECTRIC MFG. CO., ST. LOUIS, MO.

CHICAGO OFFICE, Wells Goodhue, 1564 Monadnock Block. PHILADELPHIA OFFICE, John Mustard, 1000 Betz Bldg.

# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

## ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

## Highest efficiency, largest delivery, lowest internal resistance.

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

## Cannot be damaged by excessive charge or discharge currents.

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

STRATTON

THE

# "CLARK" WIRE.

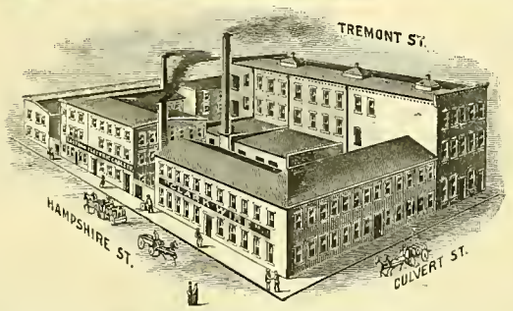
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalognee with Terms and Discounts for Quantities.

# BINDERS

For the WESTERN ELECTRICIAN

Electrician Publishing Co., 6 Lakeside Bldg., - Chicago.

**$1.00**

# Phœnix Carbon Mfg. Co.

S. G. BOOKER, Supt.

2134-2140 DeKalb Street, ST. LOUIS, MO.

# Electric Light Carbons

*We make a specialty of MOTOR and DYNAMO BRUSHES and BATTERY MATERIAL.*

It will pay you to see our product and get our prices before placing your orders.

# Siemens & Halske Electric Company of America,

*Siemens & Halske. Berlin, Charlottenburg, Vienna, St Petersburg.*

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired.**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

**See our new Catalogues. Correspondence solicited.**

# "IDEAL" INSULATED COPPER WIRE.

TRADE MARK. "IDEAL" WIRES AND CABLES

**Approved by the New York Board of Fire Underwriters.**

## The Only Authorized FIBRE COVERED WIRE for INSIDE, TUBE and CONCEALED WORK GENERALLY.

**It will not Deteriorate by long use, nor Oxidize the Copper. Finished in the following Styles: Black Polished, White and Black Glazed Braid and White Fireproof.**

We can freely recommend this Wire for all inside wiring, from the fact that recent insulation tests made by reliable authorities show that it stands very high.

## PHILLIPS INSULATED WIRE COMPANY,

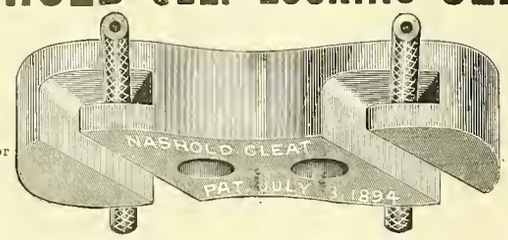
Chicago Agents, ELECTRIC APPLIANCE CO.

New York Office, 39 and 41 Cortlandt Street.

Factory, PAWTUCKET, R. I.

# NASHOLD SELF-LOCKING CLEAT.

Patented in U. S., Canada, England, France, And Applied for In Germany.



FOR SALE BY ALL ELECTRICAL SUPPLY HOUSES.

**It is the most practical Cleat made.**
**It is made of finest glazed porcelain.**
**It is in one piece.**
**It has the strength.**

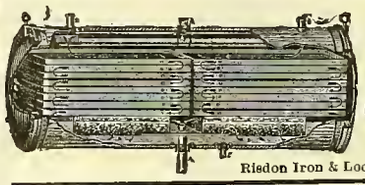
**It will lock the wire firmly.**
**It will NOT break in putting up.**
**It will NOT hold moisture.**
**It will NOT hurt the insulation.**

The wire can easily be put in place or removed without loosening the Cleat. It is a great saver in Time and Labor over any other Cleat in use for putting up Electric Light or other Wires.

## The Nashold Cleat Company,

Telephone, Harrison 636. 934-935 Monadnock Bldg., CHICAGO, ILL.

# Stilwell's Patent Live Steam-Feed Water Purifier.



**Removes all Impurities.**

Entirely prevents *scale* in Steam Boilers. Catalogue on application.

The Stilwell-Bierce & Smith-Vaile Co.,
DAYTON, OHIO.

Risdon Iron & Loc'tive Wks, San Francisco, Cal., Pacific Coast Agts.

## IMPORTANT TO COMMERCIAL TRAVELERS.

On and after December 1st, Baggage Agents of the B. & O. R. R. Co. will accept coupons from mileage books issued by B. & O. R. R., P. & W. R'y, B. & O. S.-W. R'y and Valley R'y of Ohio, in payment for excess baggage charges, at their face value, 2 cents each. This arrangement will not include B. & O. Mileage Books endorsed "good only on B. & O.," B. & O. Southwestern Mileage Advertising Books, nor hooks older than one year from date of issue.

## Cheap Trans=portation.....

One-twentieth of a cent a mile, on the **Imperial Wheel.** Cheaper than other bicycles because less repairs are needed. Our convincing catalogue for the asking.

AMES & FROST COMPANY
CHICAGO, ILL.

**NOTICE**—Bids will be received up to four o'clock p. m. of February 15, 1895, for the interior wiring and conduit work of the Second Presbyterian Church, Lafayette, Indiana. Plans and specifications may be seen at my office, Room 3 Court House. The right is hereby reserved to reject any or all bids. W. K. ELDRIDGE, Supt.

## WANTED!

A thorough and competent mechanical superintendent to take charge of an electrical manufacturing establishment. State age, experience and salary expected. Best of references required. Address

"ROYAL ELECTRIC,"
P. O. Box No. 2107, Montreal, Que.

## FOR SALE, VERY CHEAP,

Or will exchange for other material.

**8** 20-arc light U. S. E. L. Co.'s dynamos; **4** 15-arc light Hochhausen dynamos; **40** 500-volt T. H. street car motors; **100** arc lamps; **3** steam fire engines; lot new magnet wire; **2** double hoisting engines; **2** large Ferracute circular shears; **1** Bennett air compressor, 18-20x30; **1** 50-ton track scale; **23** new electric car wheels.

WALSH'S SONS & CO., Newark, N. J.
Dealers in Scrap Iron and Metals

## FOR SALE CHEAP.

# ELECTRIC RAILWAY MOTORS.

Their Construction, Operation and Maintenance.

An elementary practical hand-book for those engaged in the management and operation of electric railway apparatus.

## With Rules and Instructions for Motormen.

By NELSON W. PERRY, E. M.

Price, Postage free, $1.00. PRACTICAL AND UP-TO-DATE.

TABLE OF CONTENTS.

I. Introduction.—II. Technical Terms, etc.—III. Ohm's Law; Rate of Work; Examples.—IV. Electric Current and Its properties.—V. The Electric Current and Its Properties (continued); The Solenoid.—VI. Measuring the Current: Magnetism and Electro-Magnetism.—VII. Lines of Force; The Closed Magnetic Circuit; Magnetic Leakage.—VIII. Polarity, Magnetism and Current.—IX. Electro-Magnetic Induction; The Continuous Current Dynamo; Increase of Electromotive Force; Eddy Current in Armature.—X. Shifting of the Armature Wires; Opened and Closed Coil Armatures.—XI. Drum and Ring Armatures; Consequent Poles and Multipolar Field Magnets.—XII. Multiple Arc and Series Arrangement; Current Characteristics of Multiple and Series Arrangements in Generators.—XIII. Current Characteristics in Translating Devices; Multipolar Fields.—XIV. The Dynamo Electric Principle; Series, Shunt and Compound Winding; The Reversibility of the Dynamo.—XV. The Electric Motor.—XVI. The Electric Motor (continued) Torque.—XVII. The Line of Commutation; Counter Electromotive Force.—XVIII. Counter Electromotive Force and Speed Regulation; Requirements of Speed Regulation.—XIX. The Sperry and Johnson-Lundell Systems.—XX. The Leonard, Perry and Other Systems; The Perry System of Series Electric Traction; Storage Battery Traction; Conduit Systems.—XXI. The Management of Street Railway Motors; Sparking at the Commutator; Motor Stops or Fails to Start.—XXII. Specific Directions to Motormen.—XXIII. Instructions to Inspectors and Superintendents.—XXIV. Locating Faults; Commutators; Drop Method of Testing for Faults; Insulation Test; Bearings; Gears and Pinions; Controllers.—XXV. Trolley Wheels, Incandescent Lamps; Conclusion.

## ELECTRIC TRANSMISSION HAND-BOOK.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book deals in the author's well-known practical style with all the problems of Electric Power Transmission.

NOW READY. PRICE $1.00.

ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, CHICAGO.

# YOU NEED THESE BOOKS.

NEW
## DYNAMO TENDERS' HAND-BOOK.
By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages. 138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.
By Lieut. F. B. Badt.

**Fourth Edition. Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages. 42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.
By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.
By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS. "TRAMS."
*Their Construction, Operation and Maintenance.*
By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.
By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.
By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.
By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

*THE PRACTICAL MANAGEMENT OF*
## DYNAMOS AND MOTORS.
By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.
By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.
By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.
*Experiments with Alternate Currents.*
By Nicola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.
By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.
By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current; Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field: Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V; Transformers, Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII; Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters: Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

## Continuous Current

# Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turn-tables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# Alternating Currents.

An Analytical and Graphical Treatment for Students and Engineers.

By FREDERICK BEDELL, Ph.D.,

AND

A. C. CREHORE, Ph.D.

Cloth, 325 pages, 112 illustrations, Price, $2.50.

The present work is the first book that treats the subject of alternating currents in a connected, logical, and complete manner. The principles are gradually and logically developed from the elementary experiments upon which they are based, and in a manner so clear and simple as to make the book easily read by any one having even a limited knowledge of the mathematics involved. By this method the student becomes familiar with every step of the proces of development, and the mysteries usually associated with the theory of alternating currents are found to be rather the result of unsatisfactory treatment than due to any inherent difficulty. The first fourteen chapters contain the analytical development, commencing with circuits containing resistance and self-induction only, resistance and capacity only, and proceeding to more complex circuits containing resistance, self-induction, and capacity, and resistance and distributed capacity. A feature is the numerical calculations given as illustrations. The remaining chapters are devoted to the graphical consideration of the same subjects, enabling a reader with little mathematical knowledge to follow the authors, and with extensions to cases that are better treated by the graphical than by the analytical method

CONTENTS.

**Part I. Analytical Treatment**—Chapter I. Introductory to Circuits containing Resistance and Self-induction.—Chapter II. On Harmonic Functions.—Chapter III. Circuits Containing Resistance and Self-induction.—Chapter IV. Introductory to Circuits Containing Resistance and Capacity.—Chapter V. Circuits Containing Resistance and Capacity.—Chapters VI, VII, VIII, IX, X, XI. Circuits Containing Resistance, Self-induction, and Capacity.—Chapters XII, XIII. Circuits Containing Distributed Capacity and Self-induction.

**Part II. Graphical Treatment.**—Chapters XIV, XV, XVI, XVII. Circuits Containing Resistance and Self-induction.—Chapters XVIII, XIX. Circuits Containing Resistance and Capacity.—Chapter XX. Circuits Containing Resistance, Self-induction, and Capacity.

**Appendix A.** Relation between Practical and C. G. S. Limits.—Appendix B. Some Mechanical and Electrical Analogies.—Appendix C. System of Notation Adopted.

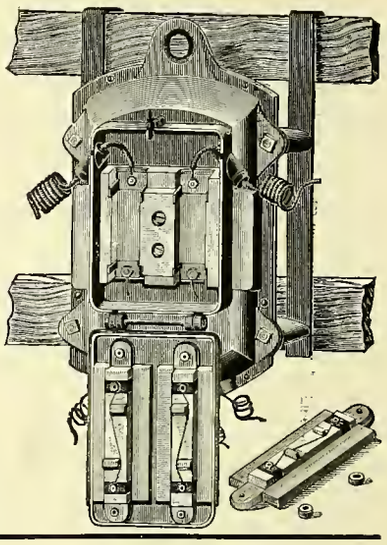
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

Chicago Office, 1307 Manhattan Building, Central Electric Co., Selling Agents.

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

## HELIOS ELECTRIC COMPANY,

1310 Filbert St., PHILADELPHIA, PA.

**AGENTS:**

Eastern Agents: STANLEY ELECTRIC MFG. CO., Pittsfield, Mass.
Western Agents: CENTRAL ELECTRIC CO., Chicago, Ill.
Southwestern Agents: ST. LOUIS ELECTRICAL SUPPLY CO., St. Louis, Mo.
New York City Agents: GLOBE ELECTRICAL SUPPLY & CONSTRUCTION CO., Vandam and Greenwich Streets.
MOUNTAIN ELECTRIC CO., Denver, Col., Agents for Colorado, Utah, Wyoming and New Mexico.
MACHINERY SUPPLY CO., Los Angeles, Cal., Agents for Lower California and Arizona.
CANADIAN GENERAL ELECTRIC CO., Toronto, Canada, Agents for Canada.
Agent for Texas: W. T. M. MOTTRAM, Dallas, Texas.

## Alternating Current ARC LAMPS.

# The Kester '95

**IS THE LAMP YOU HAVE HOPED FOR.**

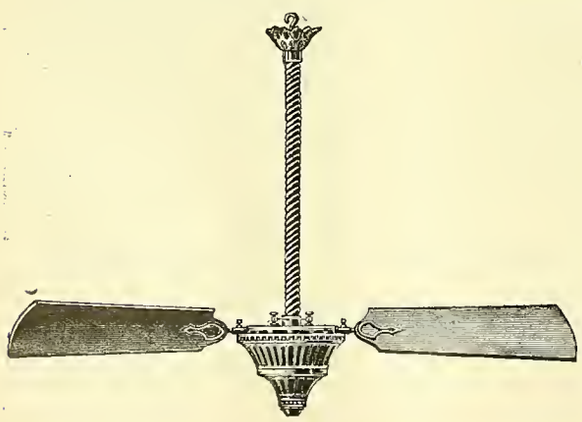
It is the only perfected Arc Lamp for the alternator, either high or low frequency.

It comprises all that is desired in an Arc Lamp.

Write for pamphlet and prices to

## THE F. P. LITTLE Electrical Construction & Supply Company,

**135 SENECA STREET,**
**BUFFALO, N. Y.**



**AN EMPHATIC SUCCESS!**
**THE DIEHL ELECTRIC FANS WIRED IN A SERIES OF TWO OR MORE ON A STREET RAILWAY CURRENT.**

**DIEHL & COMPANY, 385 BROADWAY, NEW YORK.**

# The Electric Storage Battery Company,

DREXEL BUILDING,

**Philadelphia, Penn'a.**

SOLE MANUFACTURERS —of— Chloride Accumulator

TRADE MARK.

REGISTERED SEPTEMBER 11, 1894.

*Sole owners of all Storage Battery Patents heretofore controlled by the—*

GENERAL ELECTRIC COMPANY,
THE EDISON ELECTRIC LIGHT COMPANY,
THE THOMSON-HOUSTON ELECTRIC COMPANY,
THE BRUSH ELECTRIC COMPANY,
THE ACCUMULATOR COMPANY,
THE CONSOLIDATED ELECTRIC STORAGE COMPANY
and the
GENERAL ELECTRIC LAUNCH COMPANY.

## Electrical Storage Cells of any Desired Capacity.

*Catalogues giving Capacities, Dimensions, Weights, Prices, Etc., on Application.*

Experience absolutely proves that Electric Light and Power Stations cannot be RELIABLY or ECONOMICALLY operated without ACCUMULATORS.

WHY PAY RENT?

# THE COLUMBIA

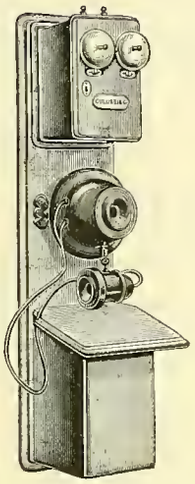
THE LATEST AND BEST.

PATENTS FUNDAMENTAL—NON-INFRINGING.

## Why Not Own Your Telephone?

**LONG DISTANCE BATTERY TRANSMITTERS**

of the latest and newest designs sold outright. No adjustment. Nothing to get out of order. Nothing demanding repair. Will convey articulate speech 1,000 miles. Constructed of the best material.



**A TELEPHONE RECEIVER**

of the newest and best pattern. Unique in design. Perfect in action. Moderate in cost. Small instruments made of the finest rubber. All wires and connections within the case. No unsightly thumbscrews.

This Company owns the patent for the improved Switch for changing the circuit of the Telephone on battery transmitters. Also for perfected system of telephone exchanges. The best DRY BATTERY manufactured. Send for Circular.

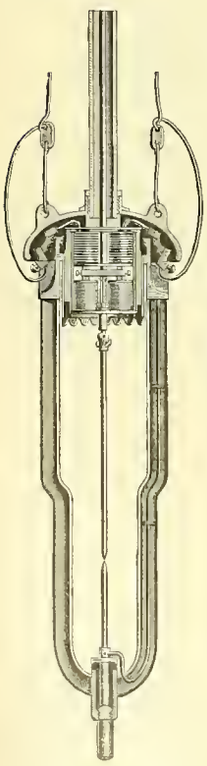
## THE COLUMBIA TELEPHONE MANUFACTURING CO.,

**136, 138, 140 Front St., New York City.**

# The "Waterhouse" Incandescent Arc Lamp.

**THE HIGHEST TYPE OF EXCELLENCE.**

Investigate its Merits Before Buying.



The "Waterhouse" Inc. Arc Lamps for DIRECT Inc. Circuits.

**WE ALSO MANUFACTURE**

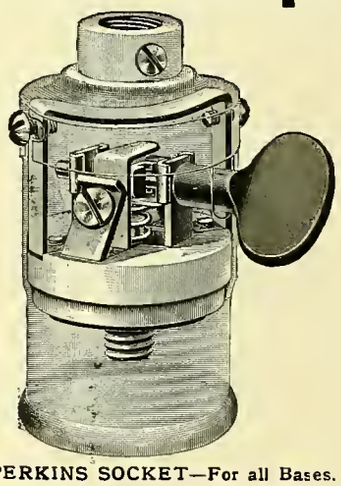
**GIBBS SWITCHES,** Single and Double Pole—All Sizes.

**PERKINS SOCKETS**—All Bases.

**DOVETAIL CEILING CUT-OUTS**—Cleat and Concealed.

These goods sold by SUPPLY HOUSES.

Write for Catalogue and Prices.



PERKINS SOCKET—For all Bases.

**FULL STOCK CARRIED IN CHICAGO.**

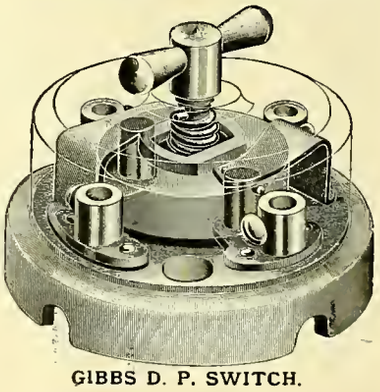
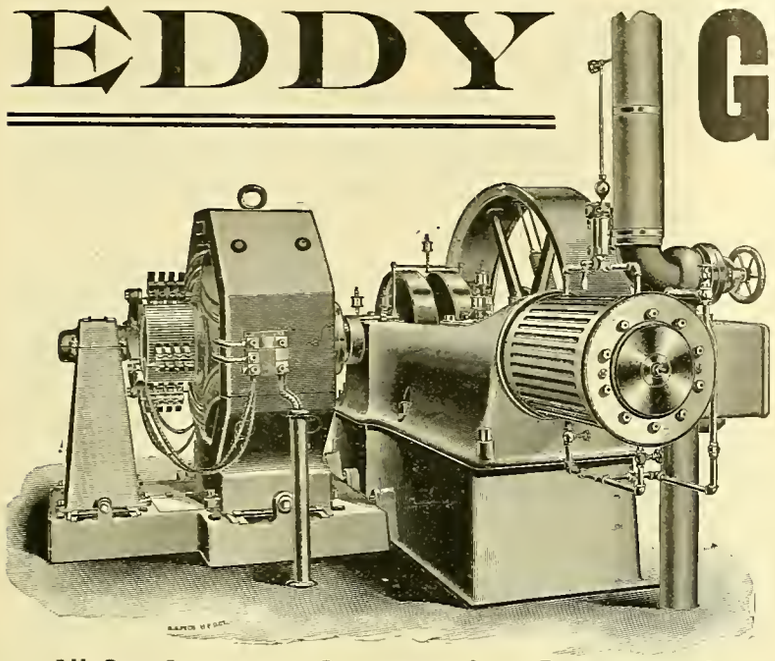
**BOSTON OFFICE: 182 Summer St. F. B. SMITH, Mgr.**



GIBBS D. P. SWITCH.

# EDDY GENERATORS



Direct Connected or Belted for Electric Railways, Central Stations, Isolated Lighting or Power Plants.

## EDDY MOTORS—SLOW, MEDIUM OR HIGH SPEED.

*We build all necessary apparatus for the transmission of Electrical Power through factory or other buildings.*

## The Eddy Electric Mfg. Co., Windsor, Conn.

NEW YORK OFFICE, HAVEMEYER BLDG.

*REPRESENTED BY:*

Walter C. McIntire & Co., 506 Commerce St., Philadelphia, Pa.
Western Electrical Supply Company, St. Louis, Mo.
F. P. Little Electrical Construction & Supply Co., Buffalo, N. Y.
W. T. Osborn, Kansas City, Mo.

All Our Apparatus Guaranteed as Represented.

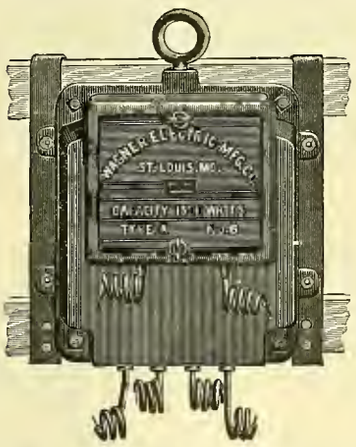
# ALTERNATING CURRENT TRANSFORMERS

Highest Efficiency Ever Obtained.

## TRANSFORMERS

To order for any purpose, voltage or capacity.

## ALTERNATING CURRENT MOTORS.



Standard Sizes, 5 Lights to 2,000 Lights.

## HIGH POTENTIAL SWITCHES,

Complete Switch Boards

For Central Stations and Isolated Plants.

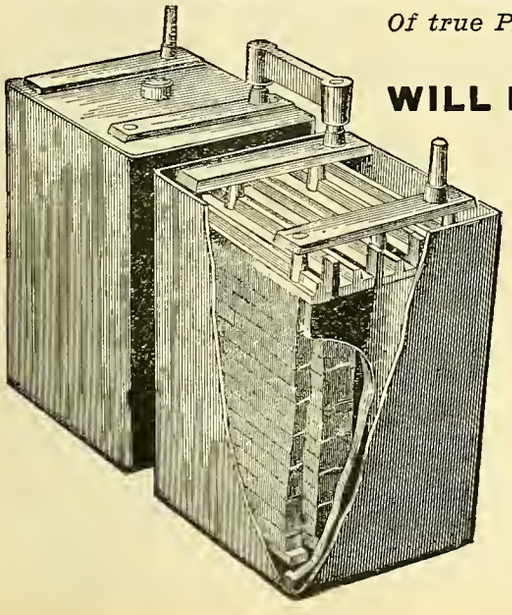
# WAGNER ELECTRIC MFG. CO., ST. LOUIS, MO.

CHICAGO OFFICE, Wells Goodhue, 1564 Monadnock Block. PHILADELPHIA OFFICE, John Mustard, 1000 Betz B'dg.

# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.



## WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.

Contain no asbestos or other separating material to increase their internal resistance.

## ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

## Highest efficiency, largest delivery, lowest internal resistance.

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

## Cannot be damaged by excessive charge or discharge currents.

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

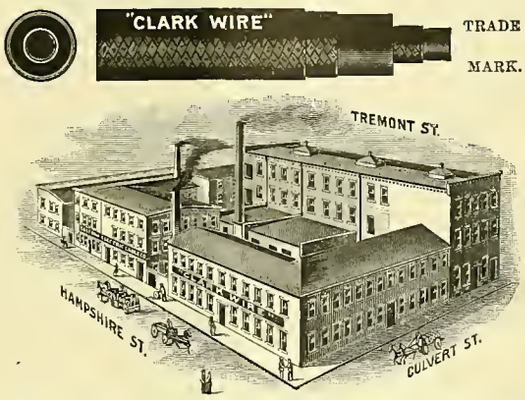
# "CLARK" WIRE.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



TRADE MARK.

In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

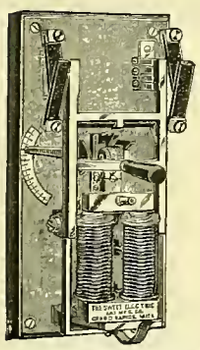
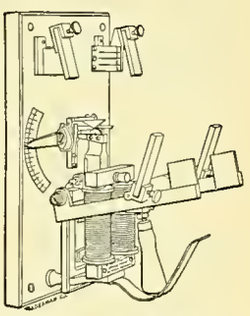
# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

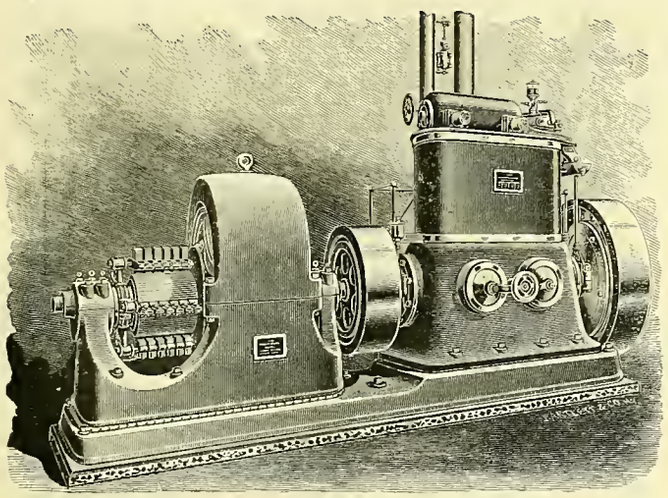
**WE KNOW YOU NEED OUR CIRCUIT BREAKER**, and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. **To be used on the Alternating or Direct Current Systems.**



**WRITE US AT ONCE.**

## SWEET ELECTRIC & MFG. CO.,

GRAND RAPIDS, MICH.



*Despite the "HARD TIMES"*

# WESTINGHOUSE ENGINE

Sales for 1894 foot up a total of 270 Engines, aggregating 37,915 H. P. No endorsement of the continued popularity and success of

## WESTINGHOUSE ENGINES

could be more emphatic! Three types covering every grade of service.

**COMPOUND.** 5 to 1000 H. P. For electric lighting, electric railways and high grade service generally.

**STANDARD.** 5 to 250 H. P. A high class steam engine for all purposes.

**JUNIOR.** 5 to 75 H. P. Low in price and thoroughly reliable.

# Just What You Are Looking For!

A NEW AND VALUABLE BOOK.

# ELECTRIC LIGHTING PLANTS,

THEIR COST AND OPERATION.

By W. J. BUCKLEY.

Data compiled from station reports of electric lighting plants employing overhead circuits, with suggestions pertaining to the information usually desired by the non-technical purchaser.

*With Numerous Illustrations, Diagrams, Plans, Tables, Etc. 275 Pages. Cloth. Price $2.00, Postage Free.*

This work gives all necessary data for the erection of an electric light plant of any size.

**THE COST OF ARC LIGHTING.** **THE COST OF INCANDESCENT LIGHTING.**

**READ THE TABLE OF CONTENTS:**

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators, Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mils of Wire, Depreciation, Direct Connected Apparatus; Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N. E. L. A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers. Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel.

**The Only Book of Its Kind in the English Language. Price, $2.00.**

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current; Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction: Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field. Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V; Transformers, Continued; Induction Coils; Converters; Transforming Up and Down: Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Coiled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

Dictionary of Electrical Words, Terms and Phrases.
By EDWIN J. HOUSTON, A. M.
562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

# HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

**By the man who made them in Germany.**

We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. **Reduced Prices on Solid Carbons for Series Arc Lighting.**

**A · Departure · In · Business · Methods!**

***NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.***

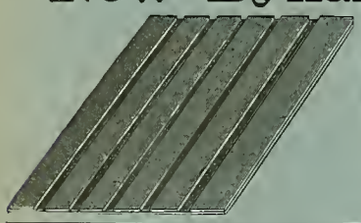
## New Dynamo Belting.

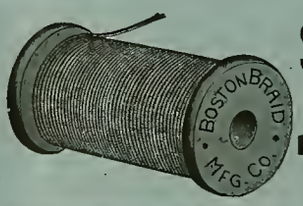


Patent Grooved Belting having Grooves running lengthwise of the Belt, serve as channels to permit the escape of air between Belt and Pulleys, to such a degree that the air cushion is overcome and the Belt can be run very slack, thereby taking the heavy strain from the bearings.

SHULTZ BELTING CO., St. Louis, Mo.

Agents in all Principal Cities.

BRANCHES:
164 Summer Street, Boston.
225 Pearl Street, New York.
129 North 3d Street, Philadelphia.

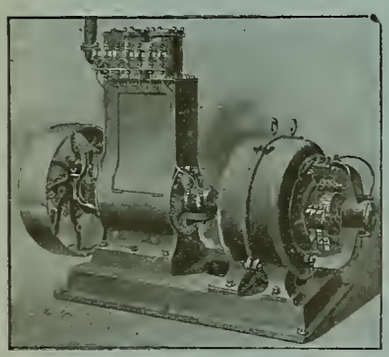


## SILK BRAID

For Incandescent Lamp Filaments.

The greatest care taken in producing a uniform article.

BOSTON BRAID MFG. CO.,
27 Beach Street, Boston, Mass.



## LUNDELL

DYNAMOS AND MOTORS.

Direct Current, Slow Speed, Iron Clad,

In Sizes up to 30 Kilowatts.

Lundell Dynamos directly connected to any type of high speed engines.

For Lundell Dynamo and Motor catalogues, prices, etc., address the

Interior Conduit & Insulation Co.
44 Broad St., N. Y.

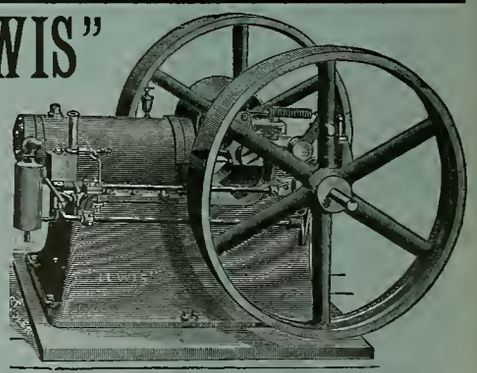
## THE "LEWIS"

Improved Gas and Vapor Engine

For Running Isolated Electric Plants,

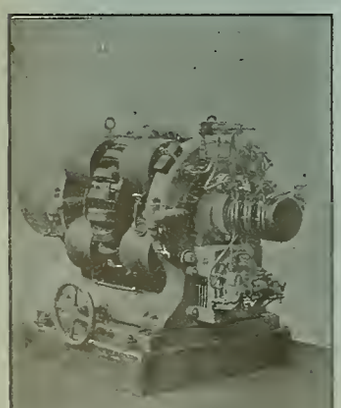
Is warranted to give a perfectly steady light, and to produce the same cheaper than gas and very much cheaper than if purchased from a central plant.

For prices and particulars inquire of the



WEBSTER MFG. CO., 1075 West Fifteenth Street, CHICAGO.

Electric Lighting and Power Apparatus.



No. 10 Arc Dynamo, 100 lights, 2,000 candle power.

THE

# WIRES AND CABLES

## HIGHEST CONDUCTIVITY, HIGHEST INSULATION.

### The Standard Wires and Cables for Aerial, Underground and Submarine Use.

The Special Attention of purchasers is called to our DOUBLE RUBBER CORE WIRE. This is a tinned copper wire enclosed in an inner core of best Para rubber free from sulphur, which in turn has a cover of vulcanized rubber. It is protected by a braid finished with a weather-proof compound, insuring the rubber from acids, alkalies and mechanical injury. It is made in three standard thicknesses of insulation—for ordinary light wiring and circuits up to 500 volts; for circuits up to 2000 volts, and for high tension work on circuits up to 5000 volts.

For submarine work the last two styles can be armored.

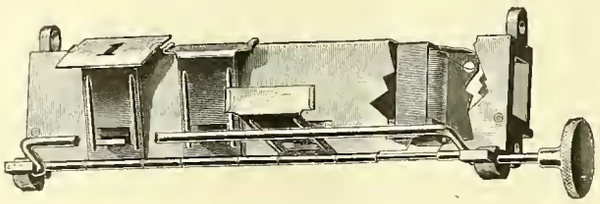
# ANNUNCIATORS

That never fail to Annunciate.



This illustrates the inside construction of our Gravity-Drop Annunciator as applied to the Eclipse Case.

No Springs. No Screws. Nothing to get out of adjustment. Simplicity itself.

*Our other Specialties:*

**REX** Wood-box Bells.

**ECLIPSE** Iron-box Bell.

## PROCTOR-RAYMOND ELECTRIC CO.,

Rochester, N. Y.

---

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

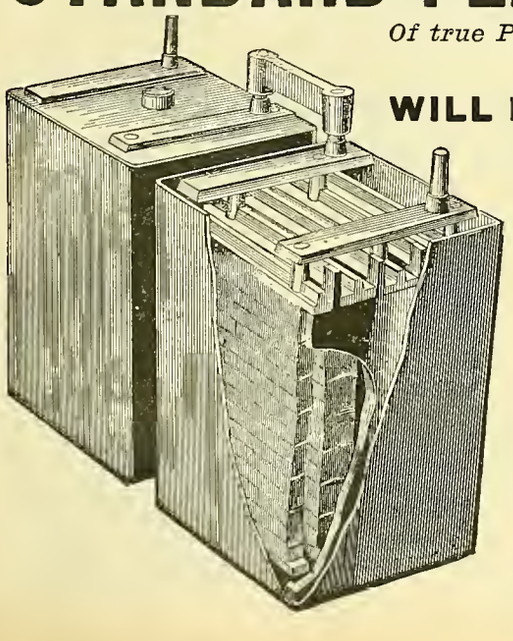
## SEE THAT YOUR TICKETS TO CLEVELAND READ VIA "LAKE SHORE."

# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*



Will give or receive without injury, currents that would destroy other batteries.

## WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.

Contain no asbestos or other separating material to increase their internal resistance.

## ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

## Highest efficiency, largest delivery, lowest internal resistance.

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

## Cannot be damaged by excessive charge or discharge currents.

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

## HELIOS CORED CARBONS For Alternating and Direct Currents.

Attempts have been made in this country to produce a satisfactory cored carbon, but failure resulted in every case. We can now assure the Electric Light Companies that our "HELIOS" CARBON is made of the same ingredients, in precisely the same way,

By the man who made them in Germany.

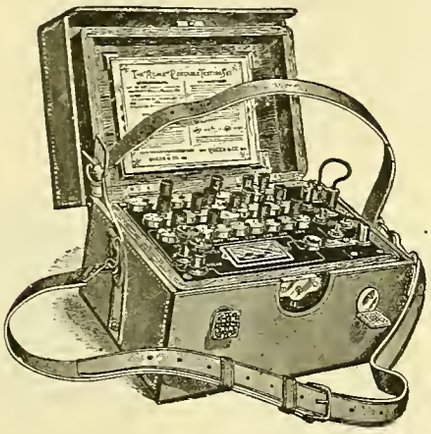
We shall be glad to hear from the Electric Light interests of the country in relation to carbons for both alternating and Direct Currents. A memorandum book, with tables showing the relation between millimeters and inches, with a list of ordinary sizes of "HELIOS" CARBONS of our manufacture will be sent on application. Reduced Prices on Solid Carbons for Series Arc Lighting.

A · Departure · In · Business · Methods!

*NOTE THIS OFFER:—Let us know by telegraph the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.*

THE WASHINGTON CARBON COMPANY, - PITTSBURG, PA.

# OHM'S LAW T146 = T156 / T459



For ***Current*** measurement use our T146, T147 or T148 ***Standard Dynamometers*** which are being sold at a lower price than ever before.

For ***E. M. F.*** use our T156 ***Acme Portable Voltmeter*** for direct and alternating circuits.

For ***Resistance*** use our T459 ***Acme Portable Testing Set.*** This set comprises a Wheatstone's Bridge, Rheostat, Galvanometer, Battery and Keys, the whole being contained in a polished mahogany case, 8¼ x 5¾ x 5 inches. The set complete weighs only seven pounds and is guaranteed accurate to one-fifth per cent. The greatly reduced price of this set should place it in the hands of every electrician.

The **ASSIGNEE'S SALE** has reduced the prices on almost all of our large line of ***Electrical Testing Apparatus.*** *Write to us* before ordering elsewhere.

***OUR SPECIALTIES*** are Magnetic Vane Volt and Ammeters, Acme Voltmeters, Electro-dynamometers, Testing Sets, Testing Batteries, Cable Testing Outfits, Photometers and Tachometers.

STRATTON

THE

# "CLARK" WIRE.

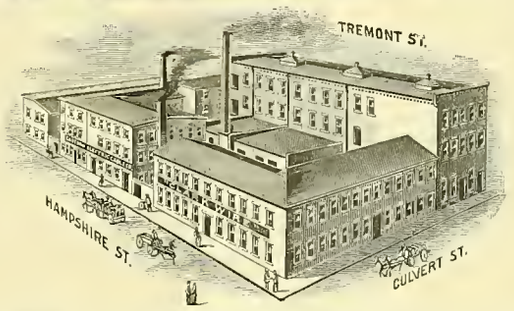
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

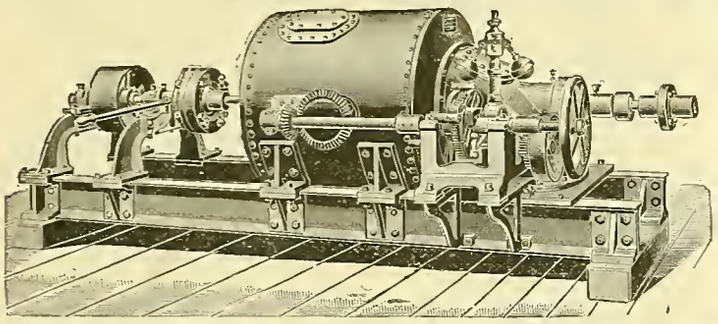
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

This book, together with an illustrated pamphlet telling "*Where the Trout Hide*" will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

## Continuous Current

# Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

**With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.**

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on Indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turn-tables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# TESLA'S NEW BOOK?

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A.M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

## ELECTRICITY FOR ENGINEERS.

**A NEW AND POPULAR BOOK.**

Two Volumes, 424 pages, Profusely Illustrated.

Price, Postage Prepaid, $2.50.

ELECTRICIAN PUBLISHING CO.,

**6 LAKESIDE BUILDING, CHICAGO.**

## New Dynamo Tenders' Hand-Book.

By F. B. BADT.

226 Pages, 140 Illustrations. Flexible Cloth Binding. Size of Type Page 5 1-2x3 inches. Price $1.00.

This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 9,000 copies of the old Dynamo Tenders' Hand-Book sold, and over 5,000 of the new.

Electrician Publishing Co.,
6 Lakeside Building, CHICAGO.

THE

## Electric Railway

IN THEORY AND PRACTICE.

Complete Treatise on the Construction and Operation of Electric Railways.

By O. T. CROSBY and DR. LOUIS BELL.

Handsomely and Copiously Illustrated.

Mailed to any Address, $2.50.

In this important new book will be found a full discussion of the principles, apparatus and methods of construction employed in electric railroading. The treatment of the subject is thoroughly practical, and will commend itself alike to the electrical engineer, the student, and the electric railway manager.

The necessity for such a book has been keenly felt by every one interested in the subject, and in need of accurate and unbiased information.

Testing of

## Insulated Wires

—AND—

## CABLES.

By Herbert Laws Webb.

A New Book Just Published.

A Practical Guide to the Testing of Electric Light, Electric Railway, Telephone and Telegraph Wires.

Price, Postage Prepaid, $1.00

THE

## Electric Motor

AND ITS APPLICATIONS.

By MARTIN and WETZLER.

325 Large Quarto Pages, 354 Illustrations.

Price $3.00.

This timely work is the first American book on Electric Motors, and the only book in any language dealing exclusively and fully with the modern Electric Motor in all its various practical applications. The book is a handsome quarto, and many of the cuts are full page

No effort has been spared to make the book complete to date, and it will prove invaluable to every one interested in the progress and development of the Electric Motor, or the electrical transmission of energy.

New and greatly enlarged edition, with an appendix on the development of the Electric Motor since 1888, now ready.

PRINCIPLES OF

## DYNAMO ELECTRIC MACHINES

—AND—

Practical Directions for Designing and Constructing Dynamos

By CARL HERING.

With an Appendix containing several articles on Allied Subjects, and a Table of Equivalents of Units of Measurements.

Cloth, 279 Pages, 59 Illustrations.

Price, Postage Prepaid, - $2.50

# The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

John A. Roebling's Sons Co.,

New York. Chicago. San Francisco. TRENTON, N. J

# FACTS:

ELECTRICALLY DRIVEN MACHINERY IS MODERN AND PROPER.
CROCKER-WHEELER APPARATUS IS THE BEST FOR THIS PURPOSE.
LIBERALLY PROPORTIONED, A GENEROUS FACTOR OF SAFETY AND ALWAYS EFFECTIVE

**Note what a recognized authority has to say on the subject.**

THE HELIOS ELECTRIC CO. PHILADELPHIA & LYNN MASS.
CABLE ADDRESS, HELIOS PHILADELPHIA
150 FILBERT ST

February, 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.
Thos. Spencer
Sup't.

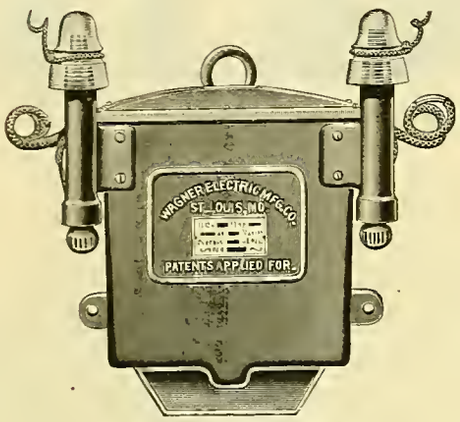
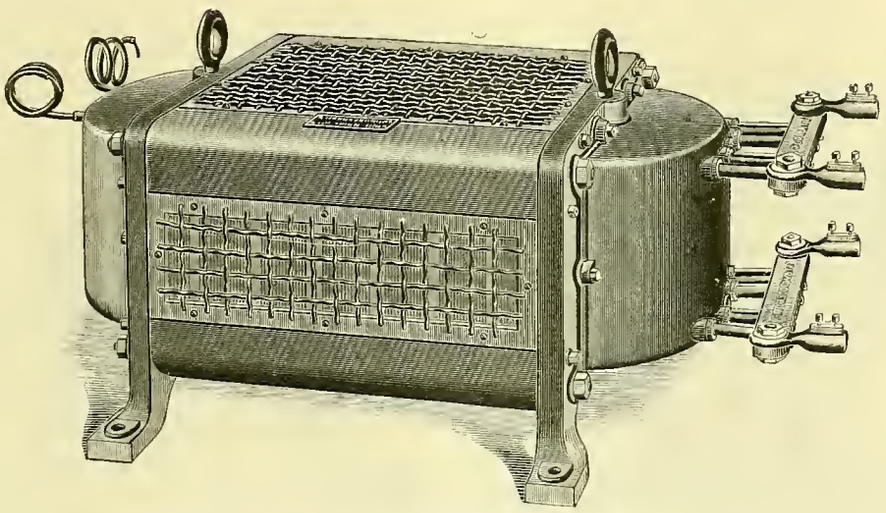
# TRANSFORMERS.



TYPE "D" TRANSFORMER.

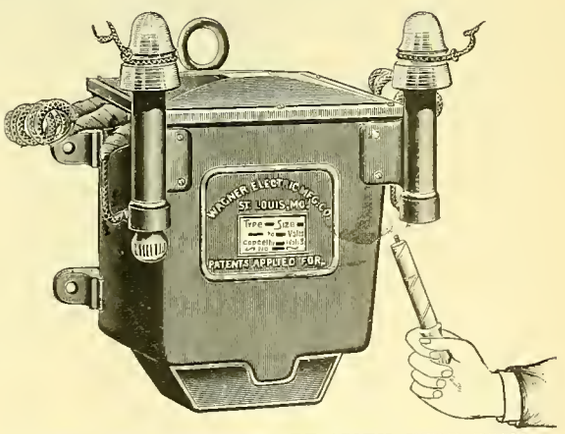
**A New Type**—*Transformer, Primary Cut-outs and Insulator Brackets all combined.*

No more brackets pulling off of walls.
With our wall or cross-arm hooks, transformer may be *Hung* and *Connected* in *Five minutes*.
No more trouble with primary fuses.
Our new fuse plugs will not hold an arc with 5,000 volts.
Absolute protection to lines and transformers secured.
Separate combination cutout brackets furnished for any purpose.
Type D transformers are made with either dry or oil insulation, as desired, and with either attached or separate primary cut-outs.



STANDARD 500 LIGHT TRANSFORMER. INDOOR TYPE.

*Our Transformers* are acknowledged by all experts to be the *Highest* in *Efficiency* ever made.
The accepted *Standard* for comparison.
The first in every competitive test.
Adopted by the largest stations in the country.
*We Challenge Competition* in any form of test, in laboratory or practical use.
One-half to one-eighth the iron loss of other transformers.
Insulation Guaranteed.



TYPE "D" TRANSFORMER WITH FUSE PLUG REMOVED.

# REMOVAL NOTICE!

Approaching the close of the third year of our business as successors to the Construction, Wiring and Supply Department of the Edison Electric Illuminating Co., of N. Y., we find that our business has successfully outgrown the facilities in our present building at the corner of Duane and Elm Streets.

We are pleased therefore to give

### NOTICE OF REMOVAL

of our Principal Offices and Salesroom to the new and commodious Building now our Works at Nos. 572 to 578 First Avenue, corner 33d Street.

We shall continue business at 59 Duane Street as a Branch Salesroom for the convenience of nearby customers and as a Branch Supply Depot for other contractors, but the more central location of our new headquarters and the increased facilities consequent upon bringing together our Executive, Selling, Constructing, and Manufacturing forces in one building will enable us to meet the demands of our rapidly increasing business more promptly and thoroughly than ever.

# NEW YORK ELECTRIC EQUIPMENT COMPANY,

## The Dayton Fan & Motor Company,

DAYTON, OHIO.

# IT IS SO.

James Brown & Son of 114 Wood St., Pittsburgh, Pa., have just completed a nine-story building, known as the Smith Building, in this city. This building is fire-proof throughout, having steel girders and cement floors. Weather-proof wire and brass covered conduit, of the Interior Conduit make, was the material used. All cement floors were laid after tubes and wires were in position, which is generally known to be very trying on electrical construction work. When the whole of the work was completed and building finished, ready for occupation, a thorough test was made by the Fire Marshal Inspector. Wheatstone bridge being used, and the resistance between ground and copper was more than 1,118,000 ohms; this certainly counts with people that think, and shows, at a glance, the class of work that is done by this firm.

This same firm has been awarded the contract for whole of the Electrical work of the Casino Building, Pittsburgh.

They are to place in position two 45 K. W. Multipolar Dynamos of General Electric type, one 20 horse power motor, 44 Arc Lamps, two 67 horse power Russell Engines, and a large quantity of Incandescent Lights, together with all the necessary construction work for the above.

This building is to be one of the finest in this section of the country, and we believe this firm will do justice, and live up to their contract in every detail.

The senior member of this firm has had many years' practical experience in this business, and has completed many similar contracts. They carry in stock a full line of Electric Supplies of every description. They are also makers and dealers in Gas, Electric and Combination Chandeliers, and are in a position to fill all orders promptly, and it may be to the interest of intending purchasers to consult them before placing their orders.

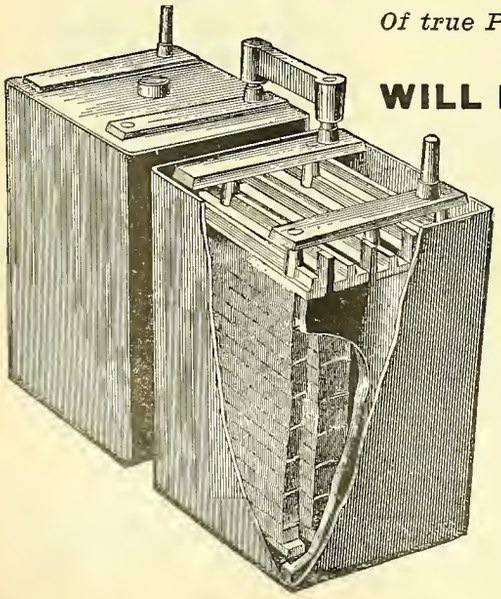
# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

## WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.

Contain no asbestos or other separating material to increase their internal resistance.

## ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

## Highest efficiency, largest delivery, lowest internal resistance.

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

## Cannot be damaged by excessive charge or discharge currents.

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

THE

# "CLARK" WIRE.

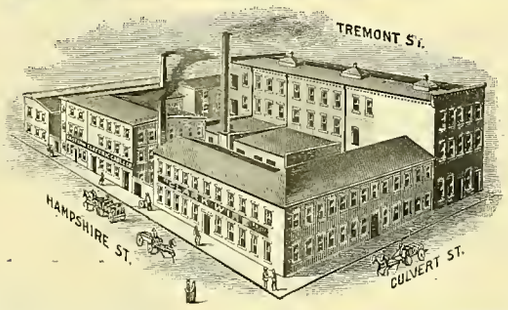
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

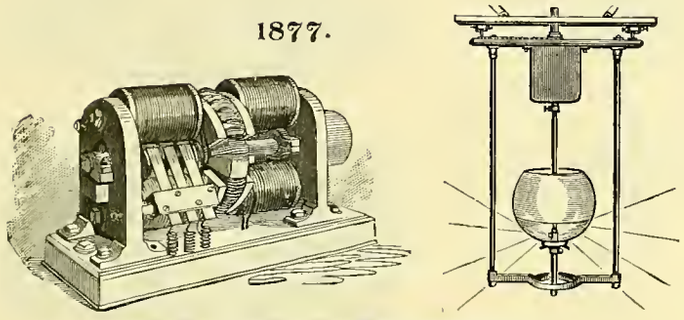
# THE BRUSH

## Electric Co., Cleveland, Ohio.

1877.



THIS IS WHAT THEY BOUGHT.

BALTIMORE, MD, April 10, 1893.

**BRUSH ELECTRIC CO., Cleveland, Ohio.**

GENTLEMEN:—We have this day shipped to you by express the little Dynamo which was purchased from you by our predecessors, Messrs. Davis & Watts in 1877.

This machine has been in constant use since it was purchased until about four years ago and then it was laid aside, from no fault or failure, but because we had a larger one in circuit for lighting our premises, we do not need this little one. The repairs have simply amounted to such supplies as segments and brushes.

We part with the little old friend regretfully, but consider that it is going home to rest, and will be better preserved than with us.

Yours very truly,
THE VIADUCT MANUFACTURING CO.,
By A. G. Davis, Prest.

1895.

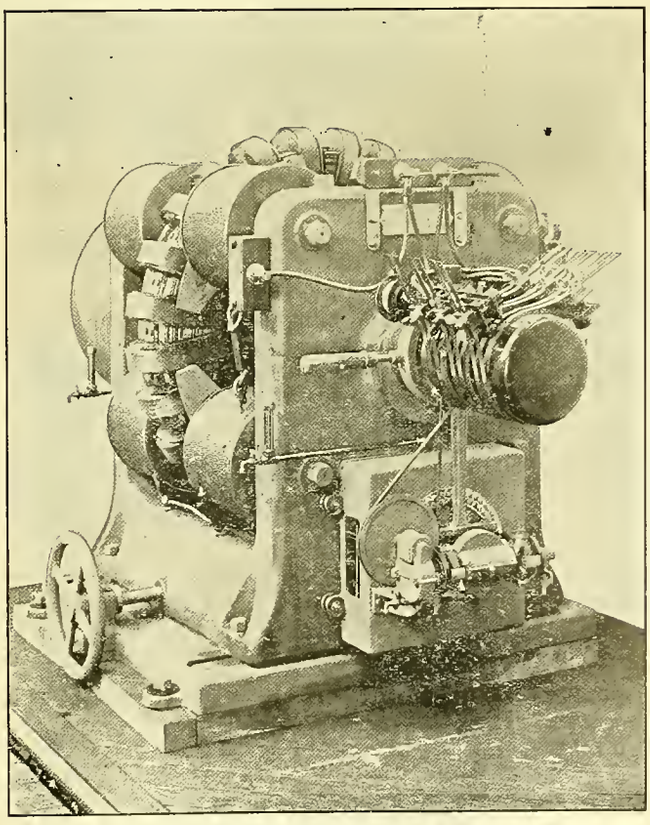
**The following is from one of the oldest and largest Electric Light Companies in the Country.**

February 5, 1895.

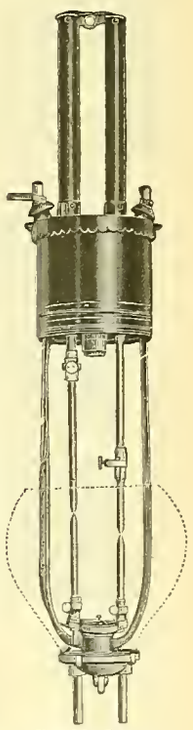
GENTLEMEN:—We have been in the local electric lighting business for more than thirteen years—being one of the oldest companies in the country—and have used, in our experience, nearly every style of arc dynamo and lamp placed on the market.

For the past two years we have been using Brush Adams arc lamps, and our recent order to you for dynamos of 1500-2000 C. P. arc lamp capacity will indicate what we think of Brush apparatus.

As far as the Brush-Adams lamps are concerned, we can only say that they have been by all odds the most satisfactory lamps we have ever used, and our experience with the Brush dynamos has been fully as good.



No. 11 Brush Arc Dynamo with Automatic Regulator.
Capacity 125 2000-C. P. Lamps

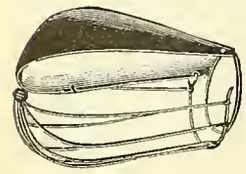


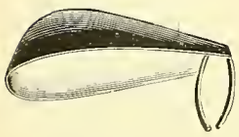
Double Lamp.
The MODERN all-night Arc Lamp.

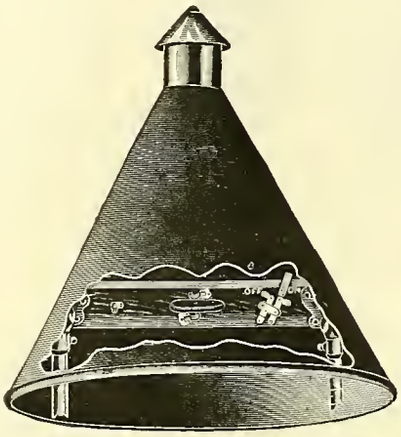
THIS IS WHAT THEY BOUGHT.

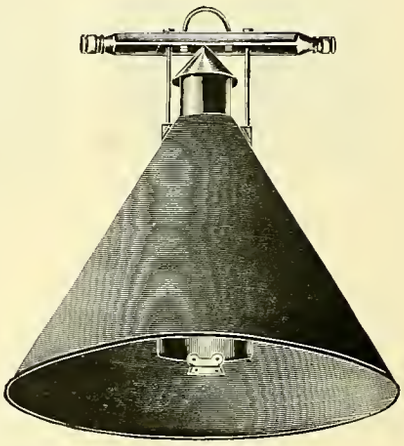
# THE BUTLER MANUFACTURING CO.

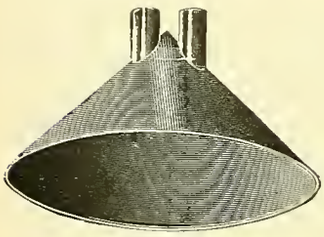
We manufacture the Best Line of Electric Lighting Specialties to be found anywhere. Here are a few that we aim to keep constantly in stock. Do you use them? Can you sell them?

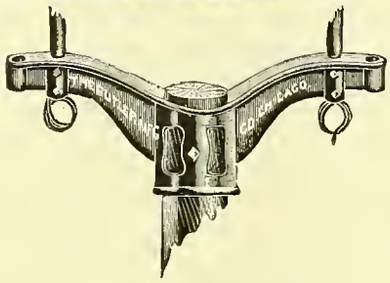


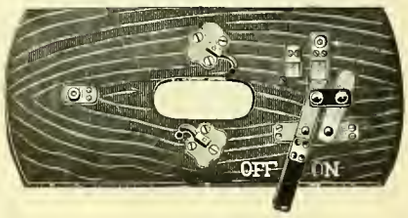


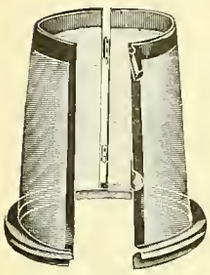


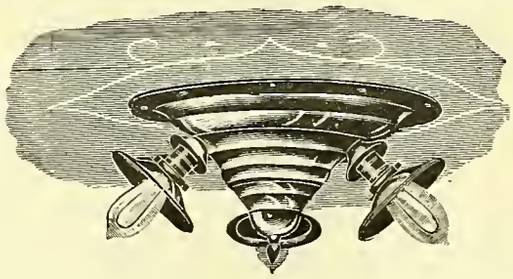


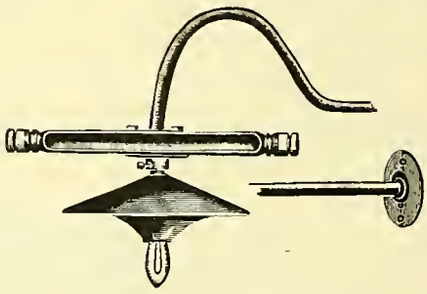


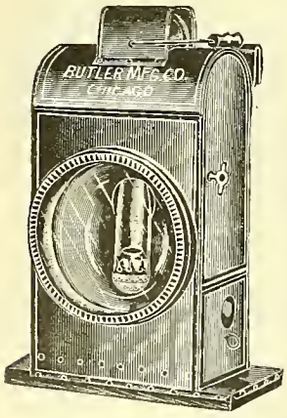


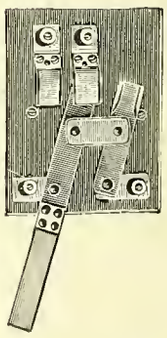


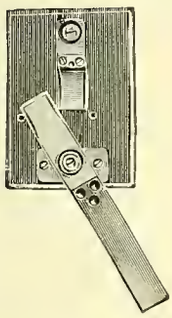


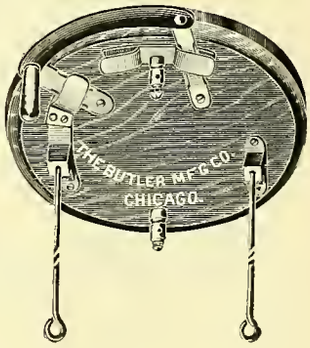












Send for our catalogue No. 894. It may interest you.

## The Butler Manufacturing Co., - Chicago.

# The Electric Storage Battery Company,

DREXEL BUILDING,

**Philadelphia, Penn'a.**

SOLE MANUFACTURERS —of— Chloride Accumulator

TRADE MARK.

REGISTERED SEPTEMBER 11, 1894.

*Sole owners of all Storage Battery Patents heretofore controlled by the—*

GENERAL ELECTRIC COMPANY,
THE EDISON ELECTRIC LIGHT COMPANY,
THE THOMSON-HOUSTON ELECTRIC COMPANY,

Alternating Current

ARC LAMPS.

The Kester '95

IS THE LAMP YOU HAVE HOPED FOR.

It is the only perfected Arc Lamp for the alternator, either high or low frequency.

It comprises all that is desired in an Arc Lamp.

Write for pamphlet and prices to

THE F. P. LITTLE
Electrical Construction & Supply Company,
135 SENECA STREET,
BUFFALO, N. Y.

## Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

FOR STREET, PAVEMENT AND INSIDE LIGHTING.

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

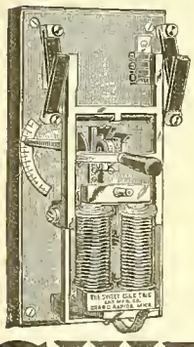
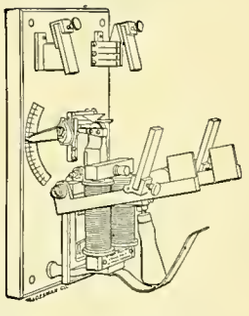
Agent for Texas: W. T. M. MOTTRAM, Dallas, Texas.

# Hot Stuff.



No! we make the final break off from carbons so that it is impossible to get heat enough to fuse points of your copper contact plates; no filing off of rough points, no hanging on after you have had a short circuit or over load, bound to work as easily after opening 1,000 times as it does when opened the first time.

WE KNOW YOU NEED OUR CIRCUIT BREAKER, and do not see why you should delay writing us any longer. One burn out will pay for a dozen of our instruments. To be used on the Alternating or Direct Current Systems.



WRITE US AT ONCE.

SWEET ELECTRIC & MFG. CO.,
GRAND RAPIDS, MICH.

# P B INSULATING COMPOUNDS AND TAPE.

# P AND B Armature AND Field Coil Varnish.

WITHOUT AN EQUAL. BEWARE OF IMITATIONS.

OUR TRADE-MARK IS ON EVERY PACKAGE.

ACCEPT NO SUBSTITUTE. THERE ARE NONE "JUST AS GOOD."

IMITATION IS THE BEST PROOF OF SUPERIORITY.

The P. & B. Products are in such demand that certain manufacturers in their efforts to effect sales, offer their materials under trade-marks so similar to the well-known P. & B. as to be misleading.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current: Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction: Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation: The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wait Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Mageto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field. Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature; Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V: Transformers, Continued; Induction Coils: Converters; Transforming Up and Down: Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Different at Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

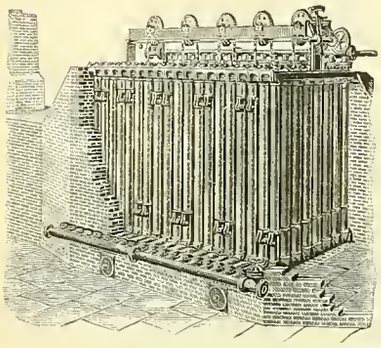
# GREEN'S

PATENT FUEL

# ECONOMIZER

**FOR STEAM BOILERS.**



**ADVANTAGES:**

High temperature of feed water, in many cases up to 300 degrees, thereby effecting a GREAT SAVING IN COAL.

Increased heating surface, thereby increasing capacity of the boilers.

A large volume of water always in reserve at the evaporation point, ready for immediate delivery to the boilers.

Acting as an efficient water purifier and keeping the heating surface of the boilers clean, the result being FUEL SAVED.

Can be applied to ANY TYPE of boilers without stoppage of works.

**Only Medal Awarded for Flue Heater at the Columbian Exposition.**

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sisk, man, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

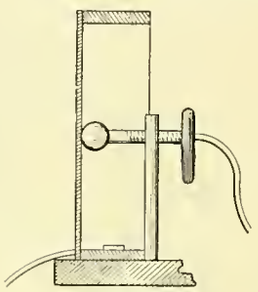

FIG. 44. BERLINER'S FIRST TRANSMITTER.

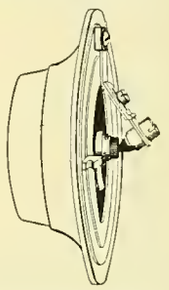

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

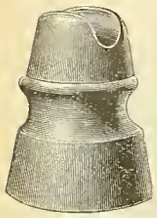
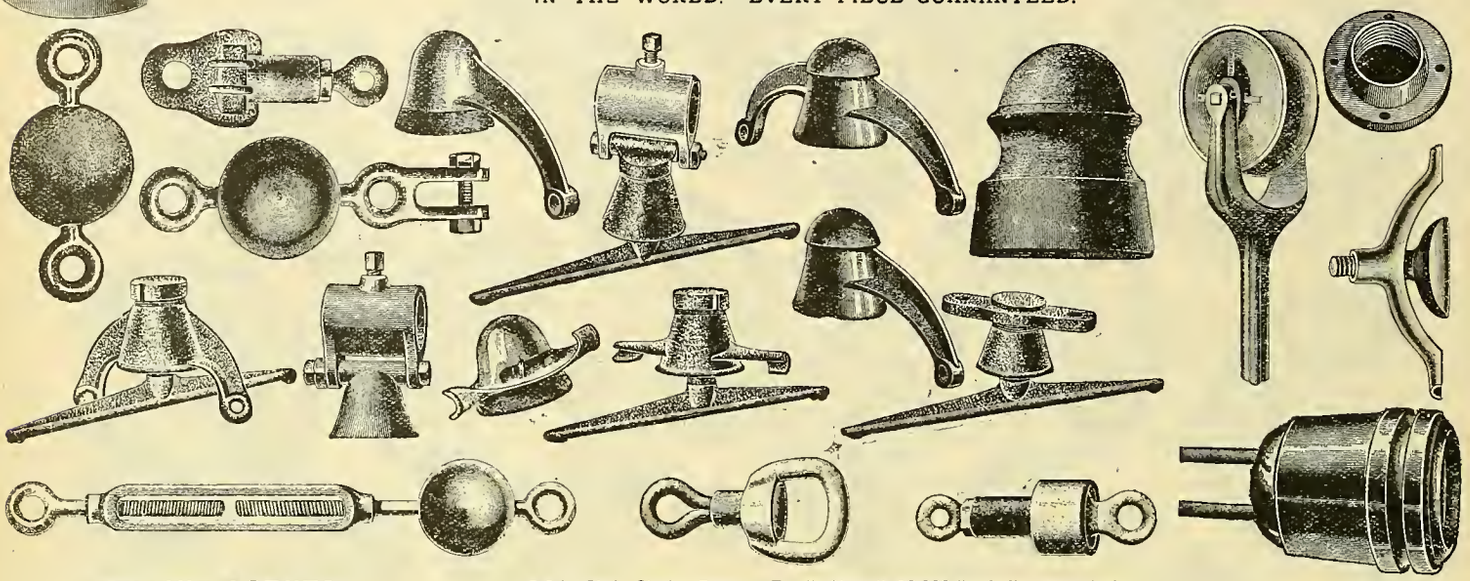
# THE MEDBERY INSULATION



## ALUMINUM-BRONZE OVERHEAD TROLLEY EQUIPMENT.

FOR ELECTRIC RAILWAYS. LEADS ALL OTHERS, AND IS THE STANDARD OF THE WORLD. HIGHEST ELECTRICAL RESISTANCE, AND GREATEST TENSILE STRENGTH. THE BEST IN THE WORLD. EVERY PIECE GUARANTEED.



**SELLING AGENTS.**

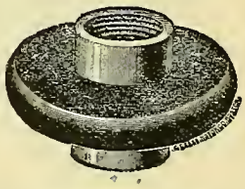
MASON ELECTRIC CO., Chicago, Ill.
THE E. S. GREELEY & CO., New York.
HUBLEY MANUFACTURING CO., Lancaster, Pa.
DRAKE, PAYSON & WHITTIER, Providence, R. I.
A. T. MOORE, JR., Buffalo, N. Y.
TECHNIC ELECTRICAL WORKS, Philadelphia, Pa.
AHEARN & SOPER, Ottawa, Ont.
A. W. SOLOMON, Savannah, Ga.
REGER & ATWATER, San Francisco, Cal.
THE OAKMAN ELECTRIC CO., New York.

5-8 in. Studs, Steel or Bronze. Tensile Strength 90,000 lbs. to the square Inch.
ADOPTED BY THE BEST RAILROADS IN THE COUNTRY.

## THE FIBERITE COMPANY,

Manufacturers of Trolley Wheels and Harps, Cross-overs, and Everything in Line Material.
Write for Catalogue and Discounts.

**MECHANICVILLE, N. Y.**



In the words of Chas. Bradshaw, the superior quality of our **Helios Cored Carbons** is a fact which "**Reason Perceives, Experiment Verifies** and **Experience Confirms.**"

**Note what a recognized authority has to say on the subject.**

THE HELIOS ELECTRIC CO. PHILADELPHIA, PA.
CABLE ADDRESS HELIOS PHILADELPHIA. 1310 FILBERT ST

February 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.
Thos. Spencer
Sup't.

# HELIOS CORED CARBONS

For Direct and Alternating Currents.

# SOLID CARBONS

For Series Arc Lighting.

## MOTOR AND GENERATOR BRUSHES, BATTERY CUPS, PLATES AND SPECIALTIES.

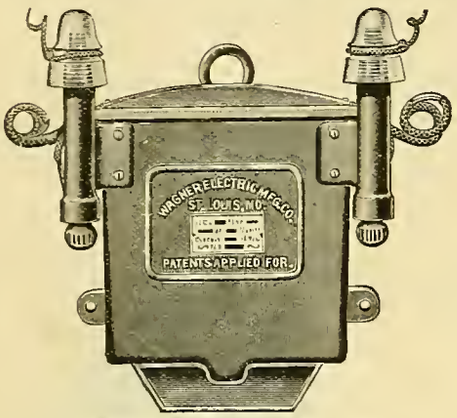
**REDUCED PRICES ON SOLID CARBONS FOR SERIES ARC LIGHTING.**

**NOTE THIS OFFER:** Let us know the price you are now paying, stating yearly consumption, and we will guarantee to beat it from 50 cents to $2.00 per thousand.

# THE WASHINGTON CARBON COMPANY,

**PITTSBURGH, PA.**

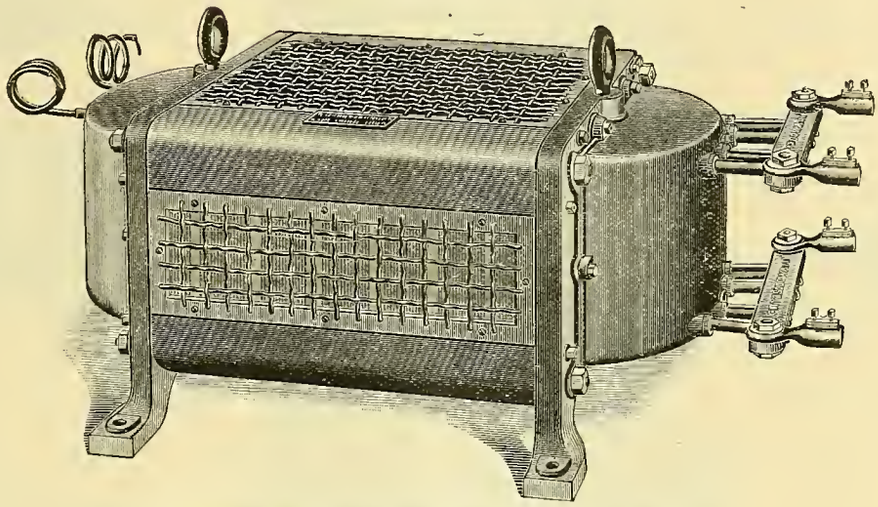
# TRANSFORMERS.



TYPE "D" TRANSFORMER.

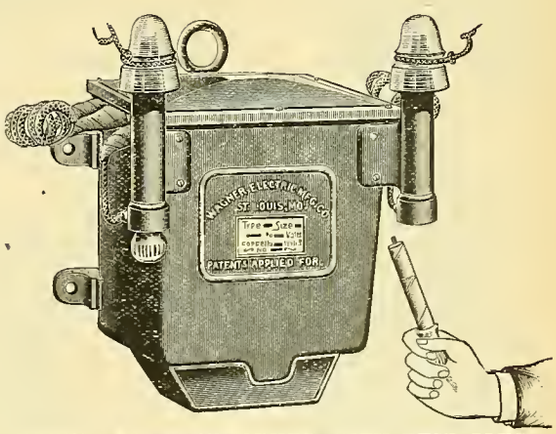
**A New Type**—*Transformer, Primary Cut-outs and Insulator Brackets all combined.*

No more brackets pulling off of walls.
With our wall or cross-arm hooks, transformer may be *Hung* and *Connected* in *Five minutes.*
No more trouble with primary fuses.
Our new fuse plugs will not hold an arc with 5,000 volts.
Absolute protection to lines and transformers secured.
Separate combination cutout brackets furnished for any purpose.
Type D transformers are made with either dry or oil insulation, as desired, and with either attached or separate primary cut-outs.

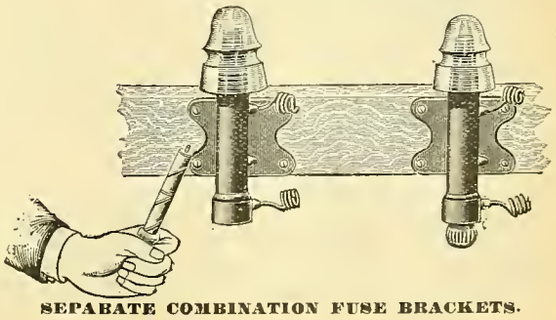


STANDARD 500 LIGHT TRANSFORMER. INDOOR TYPE.

*Our Transformers* are acknowledged by all experts to be the *Highest* in *Efficiency* ever made.
The accepted *Standard* for comparison.
The first in every competitive test.
Adopted by the largest stations in the country.
*We Challenge Competition* in any form of test, in laboratory or practical use.
One-half to one-eighth the iron loss of other transformers.
Insulation Guaranteed.



TYPE "D" TRANSFORMER WITH FUSE PLUG REMOVED.



SEPARATE COMBINATION FUSE BRACKETS.

## WAGNER ELECTRIC MFG. CO.,

ST. LOUIS, MO.

1564 Monadnock Block, Chicago, Ill.

# The Peoria Automatic Filter

We candidly recommend to all users of dynamos and other high speed fine machinery, as well as all other mechanical appliances where oil is used as a means of lubrication.

Lubricating oil which has formerly been thrown away and wasted can be saved by the use of this Filter so as to be used again indefinitely. The saving is so great that consumers can well afford to use a better grade of oil.

*Correspondence Solicited.*

Simple in Construction.

Easy in Operation.

Principles of Construction are Capillary Attraction and the Syphon.

No water being used in the Filter to wash oil, consequently the oil is thoroughly cleaned and purified.

## To pay dividends, save them.

**Fact 1**—The **Reliance Columns** prolong the life of steam boilers. How much would it be worth to you to have your boilers last, say, five years longer than they will otherwise last?

**Fact 2**—The **Reliance Columns** save repair bills. Leaky tubes and burned crown sheets are unknown where they are used.

**Fact 3**—The **Reliance Columns** save fuel. 5c a day pays 75% per annum on their cost.

**Fact 4**—The **Reliance Columns** protect life and property. What would be the cost in life, money and stoppage of an explosion in your plant?

**Fact 5**—The **Reliance Columns** are not an expense, but an investment paying phenomenal returns. The saving of fuel, saving of repairs, and prolonged life of the boilers aggregates several times their cost every year.

**Fact 6**—The **Reliance Columns** turn loss into profit. Unless you are rich you cannot afford to operate boilers without them.

**WRITE FOR CIRCULARS** and determine the matter for yourself. You need not buy unless you wish to.

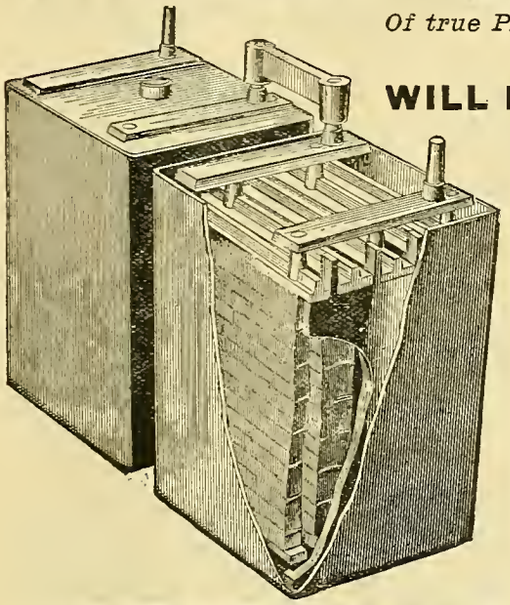
# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ **CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

**THE BEST QUALITY IS THE CHEAPEST.**

ELECTRA ·TRADE MARK·

Highest Award at the World's Columbian Exposition, Chicago, 1893.

## High Grade Nuernberg Carbons

For direct and alternating current Arc Lamps, are the most economical and efficient manufactured. They produce a very brilliant and absolutely steady light.

ELECTRA ·TRADE MARK·

Highest Award at the World's Columbian Exposition, Chicago, 1893.

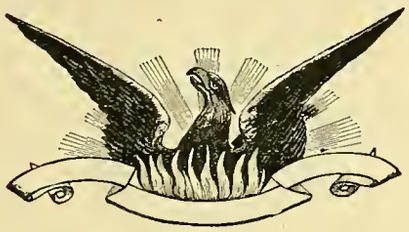
SEND FOR NEW PRICE LISTS AND SAMPLES TO

**HUGO REISINGER,** No. 38 BEAVER STREET, NEW YORK,

Sole Importer for the United States, Canada, Etc.

**NOTICE!**—It has come to my knowledge that inferior carbons are offered to the trade under the name of "Electra," which name has been properly registered by me as my trade-mark, and therefore cannot be used by anybody else without infringing on my rights. Beware of imitations, and see that every packet of carbons bears the label with my trade-mark, "Electra."

# PHŒNIX RUBBER INSULATING PAINT.



## Water, Acid, and Practically Fire Proof.

Manufactured from a newly discovered, valuable mineral, rich in its own natural oils.

A strictly first-class insulating paint for armatures, fields, switchboards, conduits, iron and wood poles, connections, mouldings, wires, cut-out boxes, lamp hoods and all other kinds of electrical appliances where high insulation is desired.

It contains no crude asphalts, tar or other deleterious substances.

Contains quick drying natural oils with more body and is far superior to the best so called insulating paint.

Makes a lasting gloss equal to varnish. Does not crack, blister or peel off. Not affected by any extremes of climates.

Will withstand the action of any acids, alkalies or salines. Has no bad odor.

In use by some of the largest electric light and electric railway plants in the United States.

Notice its Points of Excellence over all other Materials:

**Morris & MacCurdy,** SOLE MANUFACTURERS, INDIANAPOLIS, INDIANA, U. S. A.

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired.**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

THE

# "CLARK" WIRE.

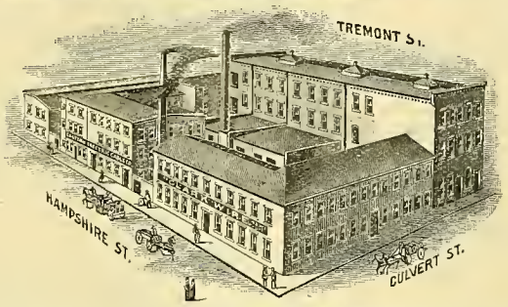
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

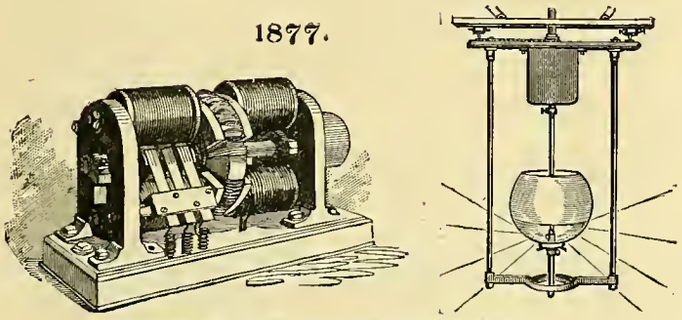
# THE BRUSH

## Electric Co., Cleveland, Ohio.

1877.



THIS IS WHAT THEY BOUGHT.

BALTIMORE, MD., April 10, 1893.

BRUSH ELECTRIC CO., Cleveland, Ohio.

GENTLEMEN:—We have this day shipped to you by express the little Dynamo which was purchased from you by our predecessors, Messrs. Davis & Watts in 1877.

This machine has been in constant use since it was purchased until about four years ago and then it was laid aside, from no fault or failure, but because we had a larger one in circuit for lighting our premises, we do not need this little one. The repairs have simply amounted to such supplies as segments and brushes.

We part with the little old friend regretfully, but consider that it is going home to rest, and will be better preserved than with us.

Yours very truly,
THE VIADUCT MANUFACTURING CO.,
By A. G. Davis, Prest.

1895.

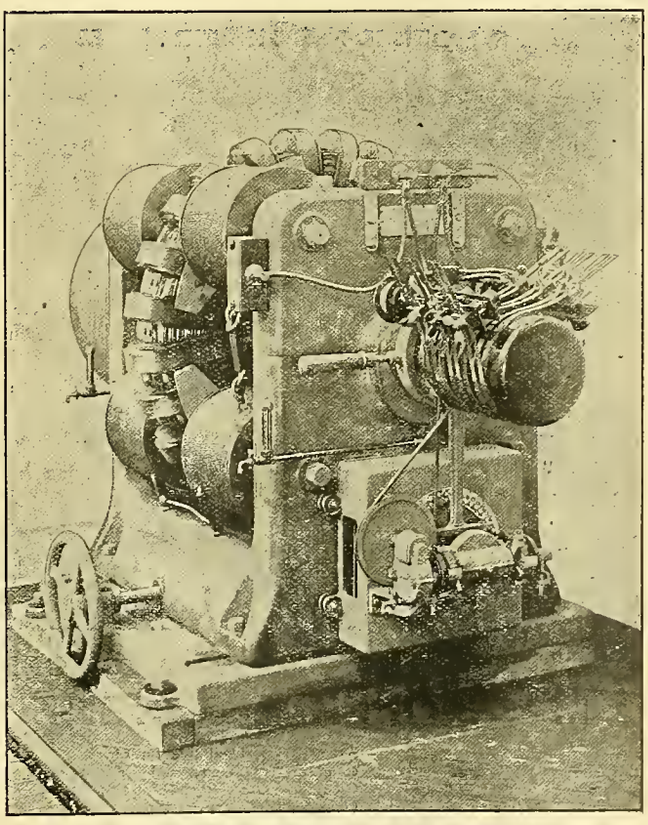
**The following is from one of the oldest and largest Electric Light Companies in the Country.**

February 5, 1895.

GENTLEMEN:—We have been in the local electric lighting business for more than thirteen years—being one of the oldest companies in the country—and have used, in our experience, nearly every style of arc dynamo and lamp placed on the market.

For the past two years we have been using Brush-Adams arc lamps, and our recent order to you for dynamos of 1500-2000 C. P. arc lamp capacity will indicate what we think of Brush apparatus.

As far as the Brush-Adams lamps are concerned, we can only say that they have been by all odds the most satisfactory lamps we have ever used, and our experience with the Brush dynamos has been fully as good.



No. 11 Brush Arc Dynamo with Automatic Regulator.
Capacity 125 2000-C. P. Lamps.

THIS IS WHAT THEY BOUGHT.

Double Lamp.
The MODERN all-night Arc Lamp.

# "A GOOD ARTICLE AT A REASONABLE PRICE."

---

A COMPLETE

## LIGHT AND POWER CENTRAL STATION IN A SINGLE ALTERNATING GENERATOR,

**RENDERED FOR THE FIRST TIME POSSIBLE BY OUR**

# MONOCYCLIC SYSTEM OF ELECTRICAL DISTRIBUTION.

Arc and Incandescent lighting circuits operated on the single phase system as from the ordinary alternator.

Generators will carry full load in lights or motors or any proportion in lights and the rest in motors. There can be no unbalancing.

Induction motors operated with results equal to those obtained with the best direct current shunt motors with the same efficiency and better speed regulation.

May be adapted to systems of secondary mains supplied from large transformers.

**For power purposes equal to a Polyphase system. With all the simplicity and advantages of the single phase system.**

# THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

*Calls the attention of users of electrical apparatus for light and power purposes to its multiphase system for the transmission of power, and invites an inspection of this apparatus at its new works at East Pittsburgh, where the machinery is now being driven by multiphase motors.*

*Notice is given that induction motors operated by the so-called "Monocyclic" system offered for sale by the General Electric Company are in fact multiphase motors, and are broadly covered by the patents of Nikola Tesla owned by the Westinghouse Electric & Manufacturing Company.*

*The motors and system of distribution advertised by the Stanley Electric Company of Pittsfield are also an infringement of the Tesla patents.*

*Suits have been brought against each of these companies, and are being pressed to a hearing as rapidly as possible.*

*It is the purpose of the Westinghouse Electric & Manufacturing Company to bring suits against all users of apparatus infringing the Tesla patents, in order that the rights of the company may be enforced.*

# YOU NEED THESE BOOKS.

## NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

*226 Pages. 138 Engravings.*

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

Fourth Edition. Tenth Thousand.

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages. 42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS. "TRAMS."

*Their Construction, Operation and Maintenance.*

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*600 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS, TERMS AND PHRASES.

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## *THE PRACTICAL MANAGEMENT OF* DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

*176 Pages.*

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.

*Experiments with Alternate Currents.*

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

# IT IS SO.

James Brown & Son of 114 Wood St., Pittsburgh, Pa., have just completed a nine-story building, known as the Smith Building, in this city. This building is fire-proof throughout, having steel girders and cement floors. Weather-proof wire and brass covered conduit, of the Interior Conduit make, was the material used. All cement floors were laid after tubes and wires were in position, which is generally known to be very trying on electrical construction work. When the whole of the work was completed and building finished, ready for occupation, a thorough test was made by the Fire Marshal Inspector. Wheatstone bridge being used, and the resistance between ground and copper was more than 1,118,000 ohms; this certainly counts with people that think, and shows, at a glance, the class of work that is done by this firm.

This same firm has been awarded the contract for whole of the Electrical work of the Casino Building, Pittsburgh.

They are to place in position two 45 K. W. Multipolar Dynamos of General Electric type, one 20 horse power motor, 44 Arc Lamps, two 67 orse power Russell Engines, and a large quantity of Incandescent Lights together with all the necessary construction work for the above.

This building is to be one of the finest in this section of the country, and we believe this firm will do justice, and live up to their contract in every detail.

The senior member of this firm has had many years' practical experience in this business, and has completed many similar contracts. They carry in stock a full line of Electric Supplies of every description. They are also makers and dealers in Gas, Electric and Combination Chandeliers and are in a position to fill all orders promptly, and it may be to the interest of intending purchasers to consult them before placing their orders.

***James Brown & Son.***

## QUALITY is our Standard of Value.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stickmag, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

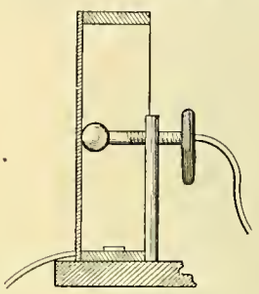

FIG. 44. BERLINER'S FIRST TRANSMITTER.

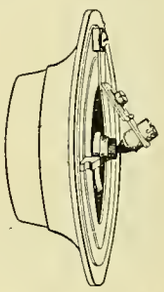

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

INGOTS, CASTINGS, WIRE, SHEET &C.

THE PHOSPHOR BRONZE SMELTING CO. LIMITED

2200 WASHINGTON AVE. PHILADELPHIA., PA.

ORIGINAL MANUFACTURERS OF PHOSPHOR-BRONZE IN THE UNITED STATES AND SOLE MAKERS OF "ELEPHANT BRAND" PHOSPHOR-BRONZE.

# CUT IN / OUT YOUR

## ARC LAMPS, MOTORS, CONVERTERS,

## Transformers, Isolated Groups,

# FROM Central Station

## WHENEVER YOUR SERVICE REQUIRES.

OUR NEW (MODEL 1895)

# ELECTRIC LIGHT AND POWER CONTROLLERS

Have been thoroughly tested and are heartily endorsed by well known E. L. managers. They are

**EFFICIENT, RELIABLE, CHEAP.**

FOR PARTICULARS ADDRESS

# Electric Selector & Signal Company,

**45 BROADWAY, NEW YORK.**

**OR ANY OF THE COMPANY'S AGENTS.**

THE QUALITY AND RELIABILITY IN

"WOOD" APPARATUS

WE MANUFACTURE

THE MOST EFFICIENT ARC AND ALTERNATING ELECTRIC LIGHTING APPARATUS

*OFFERED TO THE PUBLIC.*

Station Managers Should Remember that

BUCKLEY'S "ELECTRIC LIGHTING PLANTS, THEIR COST AND OPERATION,"

*Will be an -----*

INVALUABLE AID TO THEM

*In Operating Lighting Plants.*

Bound in Cloth, $2.00.
Bound in Paper, $1.00.

FORT WAYNE ELECTRIC CORPORATION,

FORT WAYNE, IND.

EDGERTON POTTERY CO., EDGERTON, WIS.

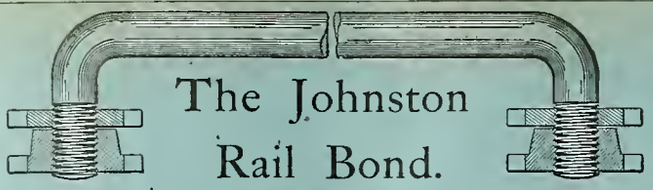
Why not get the best?

1888. 1895.

Give us trial order.

C. F. SPLITDORF, Manufacturer of

Telephone Bobbins and Spark Coils, 17 to 27 Vandewater St., New York



# The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

John A. Roebling's Sons Co.,

New York. Chicago. San Francisco. TRENTON, N. J.

GARDNER DIE STOCK

FULL THREAD AT ONE CUT. ALL PARTS SUBJECT TO WEAR ARE CASE HARDENED. ALL GUIDES OF HARDENED STEEL. ADJUSTABLE DIES EXACT SIZE IRON AND 1/32 OVER IRON CUT WITH SAME DIE.

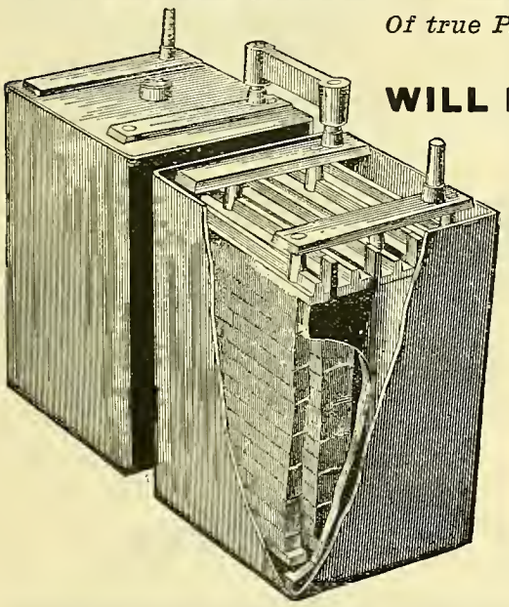
## Wagner Electric Mfg. Co., ST. LOUIS, MO.

# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ **CHALLENGE:** { We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

THE

# "CLARK" WIRE.

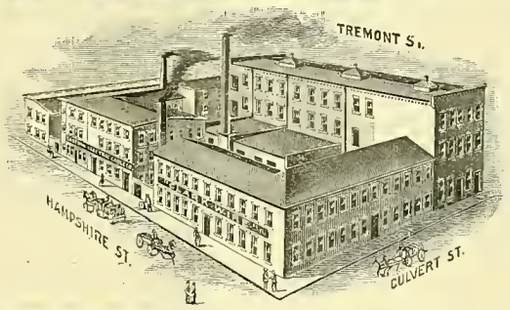
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

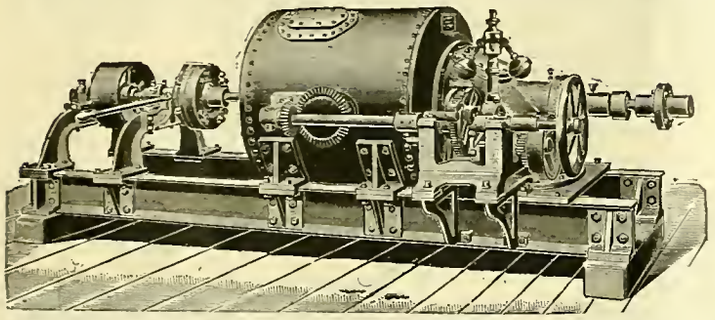
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickmao, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.
The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

# A Testimonial from the Laboratory of Thos. A. Edison.

ORANGE, N. J., February 6, 1894.

*CLONBROCK STEAM BOILER WORKS, Brooklyn, N. Y.*

DEAR SIRS:—Your letter of the 30th ultimo is received. I have a Climax boiler, and it is giving great satisfaction. Taking everything in consideration, it is, in my opinion, practically and theoretically, the best boiler so far invented.

THOS. A. EDISON.

Every Light and Power reader of the Western Electrician would do well to commit to memory the above testimonial.

# THE "MORRIN"

**CLIMAX STEAM GENERATOR**

Has been acknowledged by all practical minds the best boiler invented.

**HERE IS HOW**

The **Packard Lamps** we are now making (with platinum leading-in wires) hold up in candle power and efficiency. This test is being made on fifty 16 candle power lamps, on 98 volt circuit, and not one lamp has yet (at the end of 800 hours) burned out or shows signs of failing.

AVERAGE MEASUREMENTS.

| | Volts. | Current. | Total Watts. | Watts per C. P. |
|---|---|---|---|---|
| Initial | 98.2 | .583 amp. | 57.25 | 3.59 |
| End of 1'0 hours | 97.4 | .577 amp. | 56.23 | 3.51 |
| End of 200 hours | 96.9 | .571 amp. | 55.23 | 3.46 |
| End of 300 hours | 95 8 | .578 amp. | 55.33 | 3 49 |

Increase in Candle Power at 98 Volts.

Initial ..... 16 C. P.
End of 100 hours ..... 17.9 C. P.
End of 200 hours ..... 18.7 C. P.
End of 300 hours ..... 18.7 C. P.

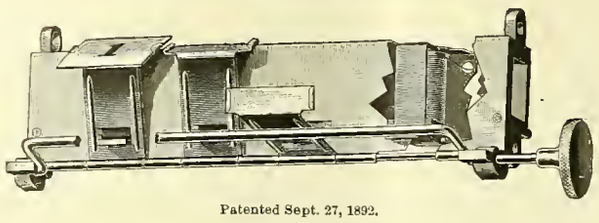
"C" STYLE.
Made in Sizes from 4 to 20 Drops.

# ANNUNCIATORS

That never fail to Annunciate.



Patented Sept. 27, 1892.

This illustrates the inside construction of our Gravity-Drop Annunciator as applied to the 4 Drop "Eclipse" Case.

No Springs. No Screws. Nothing to get out of adjustment. Simplicity itself.

*Our other Specialties:*

**REX** Wood-box Bells,
**ECLIPSE** Iron-box Bells,
**SPARK** Coils,
**WOOD** Push Buttons,
Floor Pushes,
Door Connections, etc., etc.

## PROCTOR-RAYMOND ELECTRIC CO.,

Rochester, N. Y.

# To pay dividends, save them.

**Fact 1**—The **Reliance Columns** prolong the life of steam boilers. How much would it be worth to you to have your boilers last, say, five years longer than they will otherwise last?

**Fact 2**—The **Reliance Columns** save repair bills. Leaky tubes and burned crown sheets are unknown where they are used.

**Fact 3**—The **Reliance Columns** save fuel. 5c a day pays 75% per annum on their cost.

**Fact 4**—The **Reliance Columns** protect life and property. What would be the cost in life, money and stoppage of an explosion in your plant?

**Fact 5**—The **Reliance Columns** are not an expense, but an investment paying phenomenal returns. The saving of fuel, saving of repairs, and prolonged life of the boilers aggregates several times their cost every year.

**Fact 6**—The **Reliance Columns** turn loss into profit. Unless you are rich you cannot afford to operate boilers without them.

**WRITE FOR CIRCULARS** and determine the matter for yourself. You need not buy unless you wish to.

**No more brackets pulling off of walls.**

**With our wall or cross-arm hooks, transformer may be *Hung* and *Connected* in *Five minutes.***

**Our new fuse plugs will not hold an arc with 5,000 volts.**

***Our Transformers* are acknowledged by all experts to be the *Highest* in *Efficiency* ever made.**

**Adopted by the largest stations in the country.**

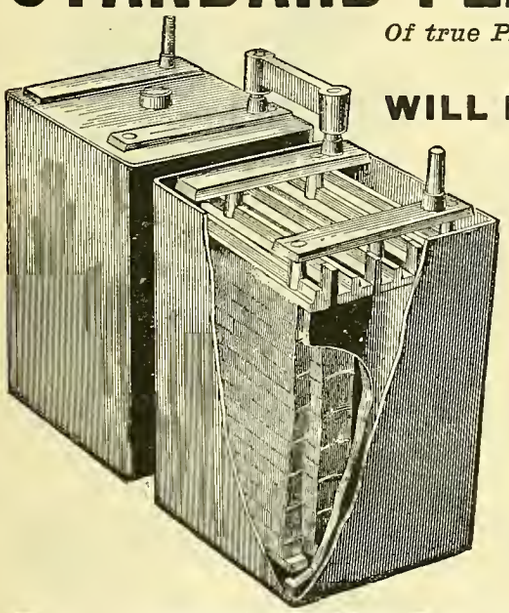
***We Challenge Competition* in any form of test, in laboratory or practical use.**

**Made in all sizes, 5 lights to 3,000 lights.**

JOHN MUSTARD, Betz Building, Philadelphia, Pa.
1564 Monadnock Block, Chicago, Ill.

## Wagner Electric Mfg. Co., ST. LOUIS, MO.

# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ **CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

THE

# "CLARK" WIRE.

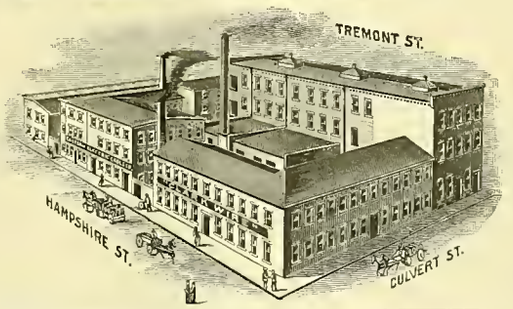
TRADE MARK

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

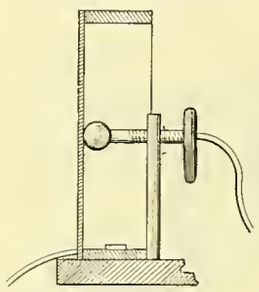

FIG. 44. BERLINER'S FIRST TRANSMITTER.

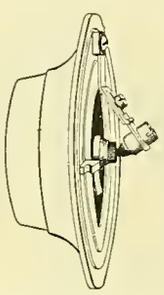

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

New Catalogue of

## Electrical Books.

The most complete of its kind ever published.

Sent Free to Any Address.

**We are Headquarters**

In the West for *ELECTRICAL BOOKS*, and fill orders promptly, prepaid, on receipt of price.

**Electrician Publishing Co.,**
6 Lakeside Building,
CHICAGO.

## Going to California.

The Burlington Route is the only railway running "Personally Conducted" Excursions via Denver to Colorado Springs, Salt Lake, Ogden, Sacramento, San Francisco, Stockton, Merced, Fresno, Bakersfield, and Los Angeles at the lowest rates and without change of cars.

Leave Chicago every Wednesday. Write or call on T. A. Grady, Excursion Manager, 211 Clark Street, Chicago.

## MAP OF THE UNITED STATES.

A large, handsome Map of the United States, mounted and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address on receipt of twelve cents in postage by P. S. EUSTIS, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

## PORTER & BUERDORF,

SALES AGENTS FOR
DETROIT SYSTEM STREET R'Y MOTORS,
Generators and Electrical Supplies.

Storage batteries for traction work *sold with guarantee* of 20,000 miles without repairs. Installation of storage battery lighting plants a specialty
**Room 808, No. 21 Quincy St., Chicago.**

**ORDERS**

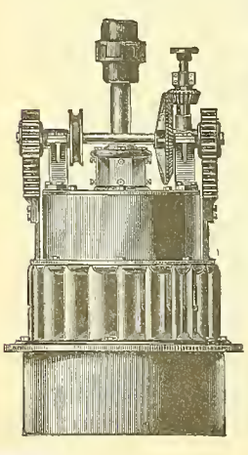
For any electrical book published filled promptly on receipt of price.

ELECTRICIAN PUBLISHING COMPANY,
6 Lakeside Building, Chicago.

**FUSE WIRE AND LINKS FOR ALL SYSTEMS.** } Correct Carrying Capacity Absolutely Uniform.

WRITE US. ALL SIZES IN STOCK.

**The Independent Electric Co.,**
39th St. and Stewart Ave., Chicago.



# THE McCORMICK TURBINE,

On Vertical or Horizontal Shaft,
Especially Adapted for Electric Work.

**Gives more power as to diameter with a higher percentage of useful effect than any other water-wheel heretofore made.** All sizes, right and left hand, are built from patterns perfected under systematic tests in the Holyoke Testing Flume.

Parties having power plants which are unsatisfactory, and those contemplating the improvement of powers, will find it to their interest to confer with me, **as I am willing to guarantee results where others have failed, no matter what make of turbine has been in use. STATE REQUIREMENTS AND SEND FOR CATALOGUE.**

**S. MORGAN SMITH, York, Pa.**

Estimates furnished for complete power plants and results guaranteed.

# TESTING

## OF INSULATED WIRES AND CABLES.

BY HERBERT LAWE WEBB.

A New Book Just Published.

A Practical Guide to the Testing of Electric Light, Electric Railway, Telephone and Telegraph Wires.

**PRICE, POSTAGE PREPAID, $1.00.**
**SEND IN YOUR ORDER NOW.**

**ELECTRICIAN PUBLISHING COMPANY,**
6 Lakeside Building, CHICAGO.

# A Testimonial from the Laboratory of Thos. A. Edison.

ORANGE, N. J., February 6, 1894.

*CLONBROCK STEAM BOILER WORKS, Brooklyn, N. Y.*

DEAR SIRS:—Your letter of the 30th ultimo is received. I have a Climax boiler, and it is giving great satisfaction. Taking everything in consideration, it is, in my opinion, practically and theoretically, the best boiler so far invented.

THOS. A. EDISON.

Every Light and Power reader of the Western Electrician would do well to commit to memory the above testimonial.

# THE "MORRIN"

**CLIMAX STEAM GENERATOR**

Has been acknowledged by all practical minds the best boiler invented.

MANUFACTURED BY

## The Clonbrock Steam Boiler Co.,

584, 566, 568 and 570 SMITH STREET,

SEND FOR NEW CATALOGUE. **BROOKLYN, N. Y.**

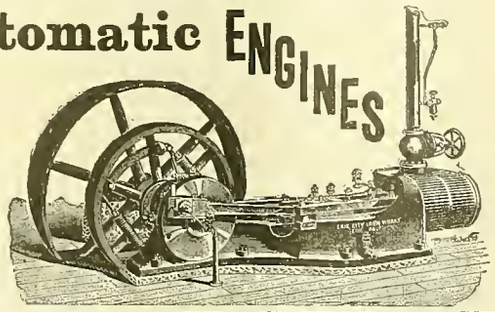
**GEO. P. FLINN, Room 21 Equitable Bldg., Boston, Mass., New England Agt.**

# ERIE CITY IRON WORKS,

INCORPORATED.

**Manufacturers of HIGH and MEDIUM SPEED**

## Automatic ENGINES



and

RETURN TUBULAR, LOCOMOTIVE AND VERTICAL **BOILERS.**

# VULCANIZED FIBRE CO.

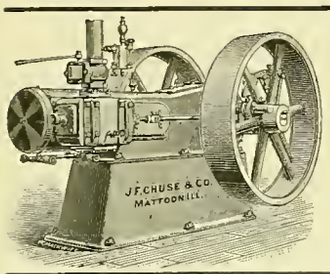
**ESTABLISHED 1873.**

**SOLE MANUFACTURERS OF**

## HARD VULCANIZED FIBRE

In Sheets, Tubes, Rods, Sticks, and Special Shapes to order. Colors, Red, Black and Gray. Send for Catalogue and Prices.

FACTORY: WILMINGTON, DEL. **The Standard Electrical Insulating Material of the World.** OFFICE: 14 DEY ST., N. Y.



## RELIABLE High Speed ENGINE.

**Automatic Cut-Off, Self-Oiling, Perfect Regulation, Simple Construction.**

Adapted for Electric Light or any Purpose requiring Power and Heavy, Continuous Work. Moderate Prices.

Write for Circulars and Prices to the Manufacturers,

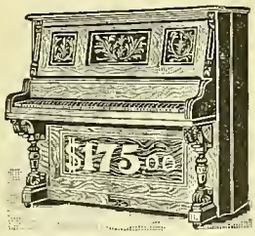
**J. F. CHUSE & CO., MATTOON, ILL.**

## Our New Book Catalogue

Which is now ready, contains 100 pages and will be found of unusual interest. Anyone wishing to obtain a complete list of all the electrical books published to date, together with descriptions of the most important, can do so by writing us.

**ELECTRICIAN PUBLISHING CO.,**
6 Lakeside Building, CHICAGO.

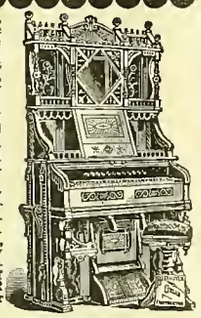
## FREE!



Our 24-page catalogue of Organs, also our new and elegant catalogue of Pianos, containing 16 pp. We have the largest manufactory in the world, from which we sell direct to the consumer at wholesale prices, thus saving the profits of the dealer and the commissions of the agents. We furnish a first-class Organ, warranted 20 years, with stool and book, for only **$27.50**

No money required until instrument has been thoroughly tested in your own house. Sold on instalments. Easy payment.

We positively *guarantee* every Organ and Piano *20 years*. Send for catalogue at once if you want to obtain the greatest bargain on earth. Write *name and address plainly*, and we will send by mail same day letter is received. As an advertisement, we will sell the first Piano of our make in a place for only **$175.** Stool, book and cover free. Regular price, $350.



**BEETHOVEN PIANO & ORGAN CO., P. O. Box 1309 WASHINGTON, N. J.**

## BINDERS —FOR THE— WESTERN ELECTRICIAN, ONE DOLLAR.

## J. G. BRILL COMPANY, - - - PHILADELPHIA,

BUILDERS OF RAILWAY AND TRAMWAY CARS OF ALL CLASSES.

Special attention given to the building of Electric Motor and Trail Cars.
Builders of Brill No. 21 Truck with solid forged frame, and "Eureka" Maximum Traction Pivotal Truck.

# New Dynamo Tenders' Hand-Book.

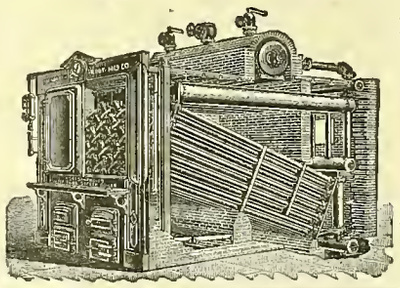
By F. B. BADT.

**226 Pages, 140 Illustrations. Flexible Cloth Binding. Size of Type Page 5 1-2x3 inches. Price $1.00.**

This is, as the name indicates, a NEW BOOK, much more complete than the old one, with all the information, instructions and rules which are required by practical men, as Dynamo Tenders, Linemen, Stationary Engineers, and owners and operators of all kinds of Electric Plants. It is the only book of the kind published in the English language. 9,000 copies of the old Dynamo Tenders' Hand-Book sold, and over 5,000 of the new.

**Electrician Publishing Co.,**
6 Lakeside Building, CHICAGO.

## THE IMPROVED ROOT WATER TUBE BOILER.



Best Adapted to High Pressures.

HIGHEST ECONOMY.

Absolutely Dry Steam.

## ABENDROTH & ROOT MFG. CO.,

28 Cliff Street, NEW YORK.

## Two Hours' Ride To Milwaukee.

Via Chicago, Milwaukee & St. Paul R'y.
Leave Chicago 3 o'clock p. m.
Arrive Milwaukee 5 o'clock p. m.
Milwaukee is a summer resort.
It is cool and pleasant.
Its hotels are the best in the west.
Start Saturday afternoon.
Come back Monday morning.
Four dollars for a round trip ticket.
Parlor car seats reserved in advance.
Chicago Ticket office, 207 Clark Street.

**NORTH STAR POINTS**

Is the title of a book of reference for all points between Chicago and Lake Superior on the line of the Milwaukee & Northern R. R., and is a valuable publication for business men and tourists who may be interested in the development of the agricultural, mineral and timber resources of Northern Wisconsin and the Upper Peninsula of Michigan. This book, together with an illustrated pamphlet telling *"Where the Trout Hide"* will be sent free upon application to Geo. H. Heafford, General Passenger Agent, "North Star Route," Chicago, Ill.

**Improved Racine High Speed**

## AUTOMATIC ENGINES

SUPERIOR REGULATION AND ECONOMY FOR ELECTRIC LIGHTING AND GENERAL PURPOSES

All sizes carried in stock. Over 2,000 in use.

Marine and Yacht Engines. Porcupine and Tubular Boilers.

WRITE FOR CATALOGUE Z

Racine Hardware Co., WORKS: RACINE, WIS.

W. F. PARISH, General Sales Manager, Home Insurance Building, CHICAGO.

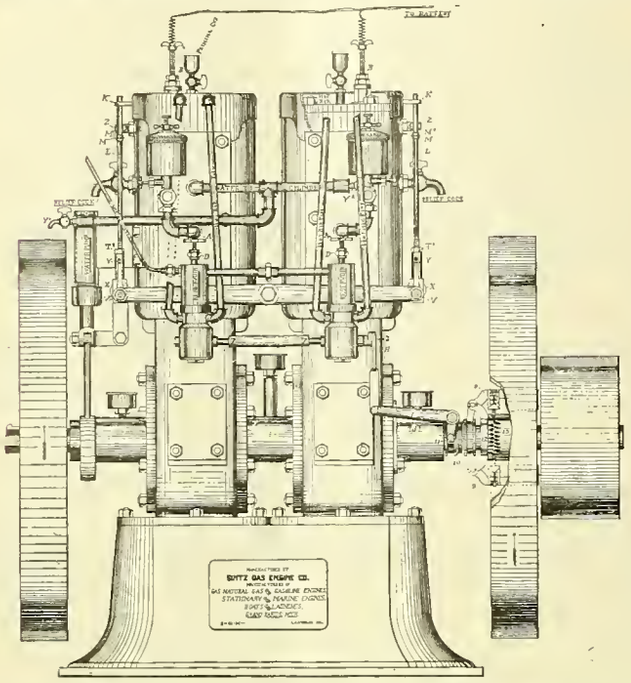
## PHOSPHOR-BRONZE

INGOTS, CASTINGS, WIRE, SHEET &c.

THE PHOSPHOR BRONZE SMELTING CO. LIMITED
2200 WASHINGTON AVE. PHILADELPHIA, PA.

ORIGINAL MANUFACTURERS OF PHOSPHOR-BRONZE IN THE UNITED STATES AND SOLE MAKERS OF "ELEPHANT BRAND" PHOSPHOR-BRONZE.

# UP-TO-DATE HIGH SPEED ENGINE.



Gas, Gasoline or Natural Gas Engines.

**TWO EXPLOSIONS AT EACH REVOLUTION.**

Especially adapted for Electric Lighting because of their high speed and regularity of power. They weigh less and occupy less space per H. P. than any engine on the market. Is practically free from valves and has only three moving parts. Send for catalogue.

**SINTZ GAS ENGINE CO.,**

242, 244, 246 Canal Street, GRAND RAPIDS, MICH.

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

**HELIOS ELECTRIC COMPANY,**

1310 Filbert St., PHILADELPHIA, PA.

**AGENTS:**

Eastern Agents: STANLEY ELECTRIC MFG. CO., Pittsfield, Mass.
Western Agents: CENTRAL ELECTRIC CO., Chicago, Ill.
Southwestern Agents: ST. LOUIS ELECTRICAL SUPPLY CO., St. Louis, Mo.
New York City Agents: GLOBE ELECTRICAL SUPPLY & CONSTRUCTION CO. Vandam and Greenwich Streets.
MOUNTAIN ELECTRIC CO., Denver, Col., Agents for Colorado, Utah, Wyoming and New Mexico.

CANADIAN GENERAL ELECTRIC CO., Toronto, Canada, Agents for Canada.
Agent for Texas: W. T. M MOTTRAM, Dallas, Texas.

# JUST OFF THE PRESS.

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

**PART I.—Polyphase Currents.**

CHAPTER 1. ..Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors —Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor
CHAPTER 21 ...Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

**PART II.—The Tesla Effects with High Frequency and High Potential Currents.**

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31....."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

**PART III.—Miscellaneous Inventions and Writings.**

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

**PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.**

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

**This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by**

# The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

Perkins Electric Switch Mfg. Co.

Hartford, Ct.

Gentlemen:-

Saturday we received notice that our last order had been shipped.

And then we are arraigned for our sins of omission and commission - to which, of course, we plead guilty - but notwithstanding our wickedness and the just indignation of our esteemed friend the undersigned he is so good as to close his indictment as follows and desire to say that if we did not consider you have an exceptionally good switch our orders for such goods would go elsewhere in the future.

We trust that nothing of this kind will occur in the future.

Yours truly,

MICHIGAN ELECTRIC COMPANY.

Geo. A. Mansfield.
Treas. & Mgr.

*WINDSOR, CONN.*

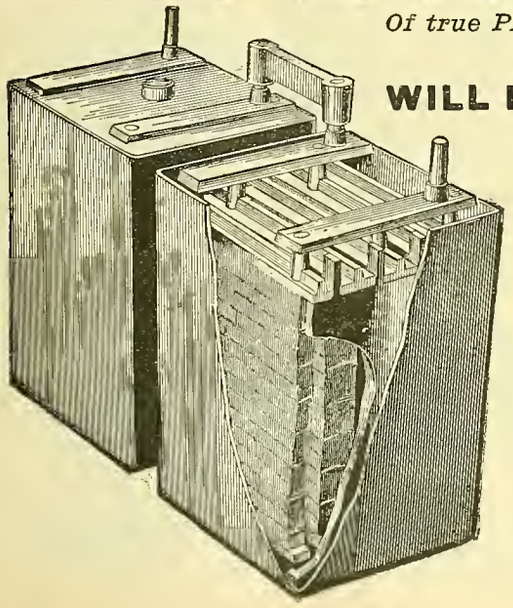
NEW YORK OFFICE, HAVEMEYER BLDG.

*REPRESENTED BY:*

Walter C. McIntire & Co., 506 Commerce St., Philadelphia, Pa.
Western Electrical Supply Company, St. Louis, Mo.
F. P. Little Electrical Construction & Supply Co., Buffalo, N. Y.
W. T. Osborn, Kansas City, Mo.

All Our Apparatus Guaranteed as Represented.

# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

## ELECTRIC POWER STORAGE COMPANY,

Room 1210 Havemeyer Building, 26 Cortlandt Street, New York.

WIRES AND CABLES

WIRES AND CABLES

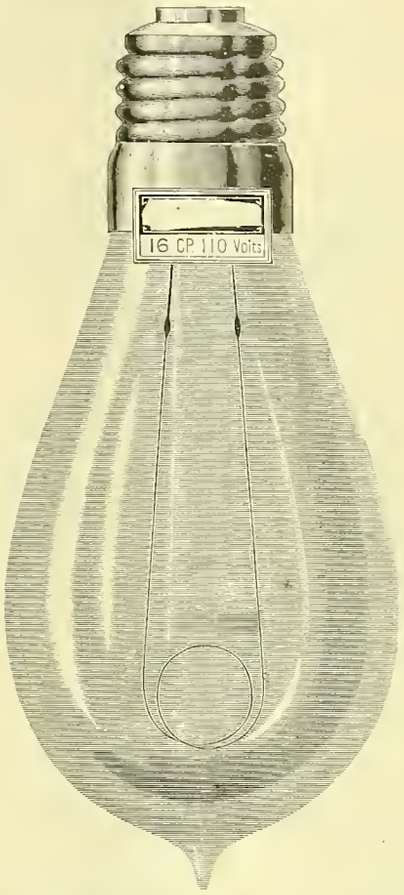
We are again prepared to furnish the

## OLD ORIGINAL AND RELIABLE

**PACKARD LAMP** with platinum leading in wires as it was made two years ago when it practically held the field against all competitors. We have, however, made one improvement securing results that no other manufacturer has ever attained, viz:

They increase in Candle Power during their life ! ! !



They increase in Efficiency during their life ! ! !

**WE ARE PREPARED TO SHIP PROMPTLY FROM CHICAGO STOCK.**

Although we are furnishing a better lamp than ever before, we are nevertheless **prepared to meet all honest competition.** We can state very positively that efficiency, life and first cost considered, we have by far the

## MOST ECONOMICAL LAMP

that has ever been offered.

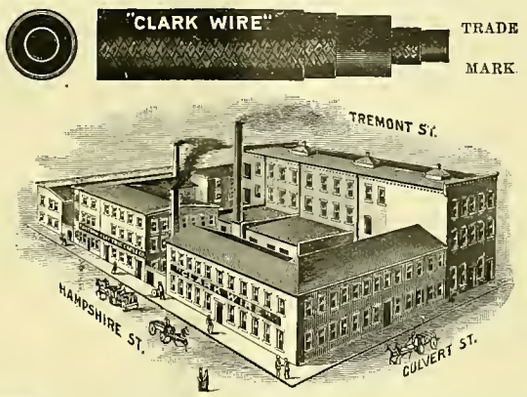
THE
# "CLARK" WIRE.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.
HERBERT H. EUSTIS, Prest. and Electrician.



TRADE MARK.

In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE HELIOS ELECTRIC CO. PHILADELPHIA, PA.
CABLE ADDRESS, HELIOS PHILADELPHIA
CODE PUBLISHED 1st

February 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.
Thos. Spencer
Supt.

In the words of Chas. Bradshaw, the superior quality of our **Helios Cored Carbons** is a fact which **"Reason Perceives, Experiment verifies** and **Experience Confirms."**

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.68 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195 19 | 82.68 |
| ¾ " | 16.78 | 117.33 | 112.60 | 175.74 | 82.18 |
| ⅝ " | 17.03 | 111.83 | 98.12 | 149.99 | 79.31 |
| ½ " | 16.88 | 118.67 | 82.07 | 118 40 | 76.62 |

Test of a 42-inch Wheel—July 14, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.33 | 128.00 | 134.18 | 199.55 | 80.50 |
| ⅞ " | 16.66 | 134.80 | 120.85 | 188.14 | 83.09 |
| ¾ " | 16.59 | 129.33 | 104.85 | 162.89 | 82.77 |

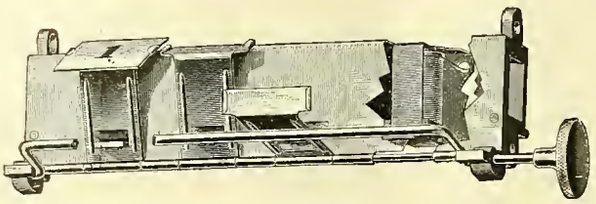
"C" STYLE.
Made in Sizes from 4 to 20 Drops.

# ANNUNCIATORS

That never fail to Annunciate.



Patented Sept. 27, 1892.

This illustrates the inside construction of our Gravity-Drop Annunciator as applied to the 4 Drop "Eclipse" Case.

No Springs. No Screws. Nothing to get out of adjustment. Simplicity itself.

*Our other Specialties:*

**REX** Wood-box Bells,
**ECLIPSE** Iron-box Bells,
**SPARK** Coils,
**WOOD** Push Buttons,
Floor Pushes,
Door Connections, etc., etc.

## PROCTOR-RAYMOND ELECTRIC CO.,

Rochester, N. Y.

# To pay dividends, save them.

**Fact 1**—The **Reliance Columns** prolong the life of steam boilers. How much would it be worth to you to have your boilers last, say, five years longer than they will otherwise last?

**Fact 2**—The **Reliance Columns** save repair bills. Leaky tubes and burned crown sheets are unknown where they are used.

**Fact 3**—The **Reliance Columns** save fuel. 5c a day pays 75% per annum on their cost.

**Fact 4**—The **Reliance Columns** protect life and property. What would be the cost in life, money and stoppage of an explosion in your plant?

**Fact 5**—The **Reliance Columns** are not an expense, but an investment paying phenomenal returns. The saving of fuel, saving of repairs, and prolonged life of the boilers aggregates several times their cost every year.

**Fact 6**—The **Reliance Columns** turn loss into profit. Unless you are rich you cannot afford to operate boilers without them.

**WRITE FOR CIRCULARS** and determine the matter for yourself. You need not buy unless you wish to.

*The Reliance Gauge Company,*
SOLE MANUFACTURERS,
85 to 95 East Prospect Street, CLEVELAND, OHIO

# Low Potential Arc Lamps.

*Alternating–Helios, Old Type.*
*Spencer, New Type.*

*Direct Current–Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

## BUTLER MANUFACTURING CO., 46 S. Clinton Street, CHICAGO.

RAMESES II. gazed thoughtfully at a decorated calendar which flapped against the embellished walls of his private office. It hung over an unused stove-pipe opening. The lazy haze of summer already permeated the air; it was the middle of June, and very hot. Rameses had discarded as much of his royal raiment as possible, without making a living picture of himself, but still he felt oppressed. A favorite valet disturbed the somnolent ether in a fitful fashion; his fan was made of double-eyed peacock feathers especially imported from the house of the great Hi Lang, China. The long handle was fashioned out of a rhinoceros tusk and inlaid with pure aluminum and incrusted with amethysts and precious stones. It was very costly. Iras, the confidential stenographer, kneeled conveniently near with a fresh tablet and a newly sharpened stylus. Rameses divided his attention between the calendar and a memorandum on his desk. He was trying to determine how it might be possible for him to raise the mortgage on his best pyramid and yet indulge in a new luxury that he had, that very morning, read of in the *Daily Papyrus*. It was a difficult problem, because the Imperial Treasurer had folded his tent intentionally and decamped with an hundred talents. He was a talented man although a thief. Things were in pretty much of a muddle, and cotton had dropped two points the day before. Suddenly a gleam of hope illumined the swarthy countenance of the king. Bringing down his fist with a bang that shook the sugar bowl on the table, he exclaimed: "This is terrible! terrible! (I wish I had that villainous Treasurer!) but I must keep cool. By Isis! I have it. Iras, take a cablegram—write '*Central Electric Company, Chicago: Send two dozen Lundell Fan Motors by first dahabiyeh, via Suez Canal, C. O. D. Rameses.*' And Iras did so and called a messenger. Then to his valet Rameses continued: "Go pawn that antequated flim-flam for a thousand denarii, and take those fan-motors out of the express office when they arrive, and—and be sure you bring me the change." And the servant departed sorrowfully, for he felt that his occupation was gone; remembering the parting injunction he muttered sotto-voice: "Y-e-s, I will, won't I?"

## What will be the next step?

Is a next step necessary? or possible?

AS IT STANDS TO-DAY.

**Iron Armored Conduit** is a concrete expression of the greatest advance yet made in the art of interior wiring. Whether there are other steps to be taken in the forward direction the future will tell; *to-day* it is all sufficient and ahead of every possible demand.

The fittings, couplings, junction boxes, the tools, all the accessories, are in keeping with this central idea of perfection.

***Conductors absolutely protected and insulated, and at the same time accessible for inspection, renewals or changes.***

Our large Chicago stock enables us to make prompt and complete shipments of Interior Conduit (iron or brass armored and plain) and all other Electrical Supplies for Central Stations, Electric Railways or Isolated Plants.

Perkins Electric Switch Mfg. Co.

Hartford, Ct.

Gentlemen:-

Saturday we received notice that our last order had been shipped.

And then we are arraigned for our sins of omission and commission - to which, of course, we plead guilty - but notwithstanding our wickedness and the just indignation of our esteemed friend the undersigned he is so good as to close his indictment as follows and desire to say that if we did not consider you have an exceptionally good switch our orders for such goods would go elsewhere in the future.

We trust that nothing of this kind will occur in the future.

Yours truly.

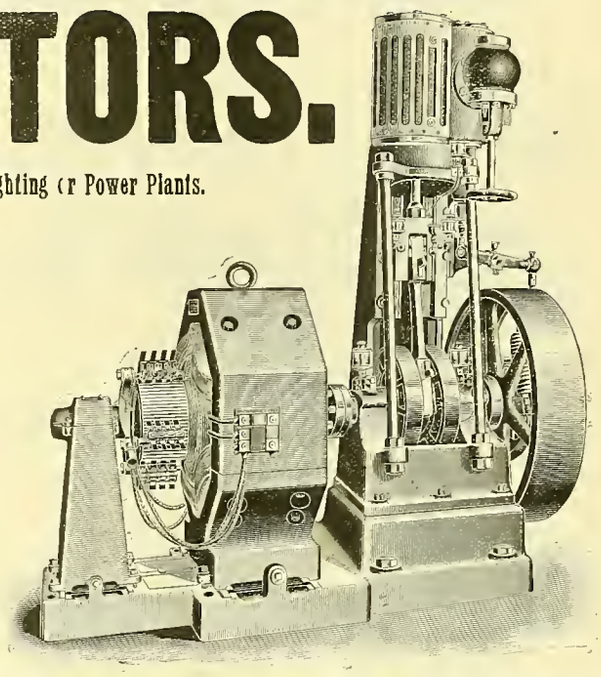
# EDDY GENERATORS.



Direct Connected or Belted for Electric Railways, Central Stations, Isolated Lighting or Power Plants.

## EDDY MOTORS—SLOW, MEDIUM OR HIGH SPEED.

*We build all necessary apparatus for the transmission of Electrical Power through factory or other buildings.*

## THE EDDY ELECTRIC MFG. CO.,

*WINDSOR, CONN.*

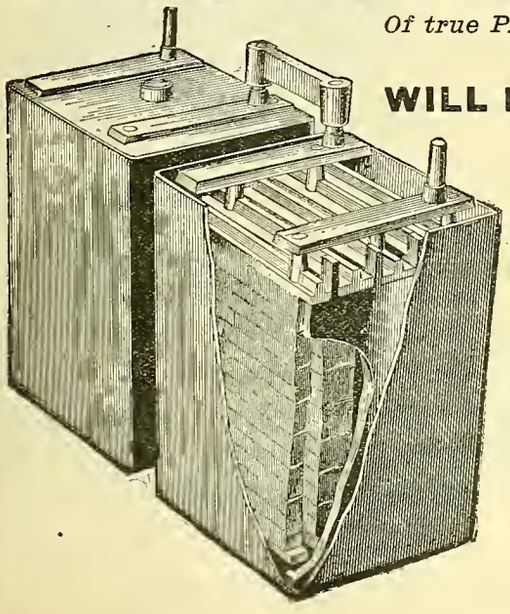
NEW YORK OFFICE, HAVEMEYER BLDG.

*REPRESENTED BY:*

Walter C. McIntire & Co., 506 Commerce St., Philadelphia, Pa.
Western Electrical Supply Company, St. Louis, Mo.
F. P. Little Electrical Construction & Supply Co., Buffalo, N. Y.
W. T. Osborn, Kansas City, Mo.
D. P. GOSLINE, 30 Oliver St., Boston, Mass.

All Our Apparatus Guaranteed as Represented.

# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

## WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.

Contain no asbestos or other separating material to increase their internal resistance.

## ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

## Highest efficiency, largest delivery, lowest internal resistance.

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

## Cannot be damaged by excessive charge or discharge currents.

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: { We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# THE BEST ELECTRIC FAN
## On the Market.

**For Alternating Current, Wound for 50 or 100 volts.**

The Fan is 14 inches in diameter.
Will always start when current is on
Positively self-lubricating, will run a whole season without looking after.
It is so constructed as to make it next to impossible to get out of line.
It is carefully made in every detail, almost noiseless, and does not throw sparks.

Agents Wanted in Different Localities.

THE

# "CLARK" WIRE.

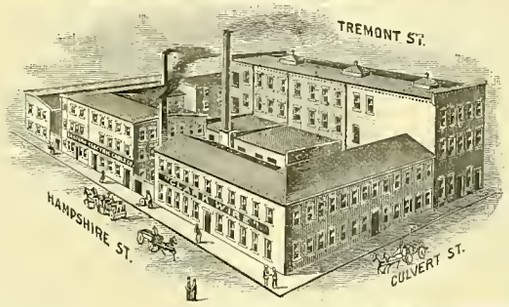
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

HENRY A. CLARK, Treas. and Gen'l Mgr.

HERBERT H. EUSTIS, Prest. and Electrician.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

THE HELIOS ELECTRIC CO. PHILADELPHIA, PA.

CABLE ADDRESS HELIOS PHILADELPHIA
(NO FULHAM'S)

February, 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.
Thos. Spencer
Supt.

In the words of Chas. Bradshaw, the superior quality of our **Helios Cored Carbons** is a fact which **"Reason Perceives, Experiment verifies and Experience Confirms."**

## HELIOS CORED CARBONS

For Direct and Alternating Currents.

## SOLID CARBONS

For Series Arc Lighting.

# PROPOSALS.

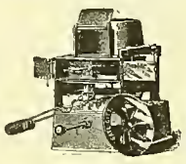
The city of Knoxville, Tennessee, is about to install its own light plant. Its light committee invites persons or firms dealing in electric lighting machinery and electrical supplies to correspond with them in reference to the immediate installation of an up-to-date electric light plant of not less capacity than 250 arc lamps of standard candle power.

J. R. WADE, Chairman.

# Proposals.

Notice is hereby given to all electric light companies supplying light to cities, that the contract by which the city of Johnstown, Pa., is now lighted will expire in September, 1895, and the councils of the city of Johnstown hereby invite proposals for the furnishing of light to the city for a term of three or five years. About two hundred (2,000 candle power) arc lamps will be required. The right of way over and through the streets and alleys will be granted for the erection of poles. A plant can be centrally located and supplied with coal at less than one dollar per ton.

**NICHOLAS & BARR,**
MANUFACTURERS OF
**GATE CITY SOLDERING FURNACE,**
28 W. Washington Street, Chicago, Ill.



The Gate city soldering furnace has the following points of excellence: 1. Economy of fuel.—2. Simplicity in construction and operation.—3. The only burner that cannot be clogged up.—4. Has a fixed pump.—5. Especially adapted to plumbers', tinners', cornice-makers' and roofers' use, and for conduit, electric light and telephone work.—6. Can be used with ease in strong wind on roofs.

# TELEPHONES!!

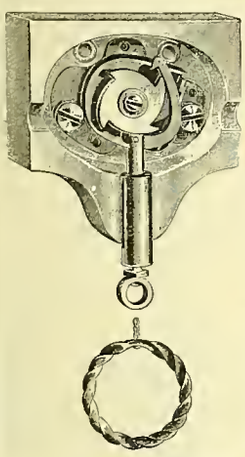
**BRYANT**
**Chandelier Switch.**



| | List Price. |
|---|---|
| 5 Amp., complete with 6 ft. Chain and Ring, - - - - - - each, | $1.50 |
| Extra Brass Chain, - - per foot, | .05 |
| Extra Brass Rings, - - - each, | .05 |

This Chandelier Switch is intended to be placed in the canopy of the chandelier, and is fitted with a clamping attachment on the back which clamps around the pipe, and is held in place by a set-screw. Is rated at ten amperes. The chain can be dropped down between the pipe and the shell of the chandelier, or through a small hole in the canopy outside of the chandelier. It is fitted with brass ring hanging below the chandelier, the first pull of which lights the entire chandelier, the next pull cutting it off.

Chain and ring can be furnished to special finish where desired to match any finish or fixture.

# The Electric Railway of To-Day.

By H. B. PRINDLE.

60 PAGES, PROFUSELY ILLUSTRATED.

## PRICE 50 CENTS.

The author describes the **ELECTRIC RAILWAY SYSTEM** in a popular manner, using such language that the reader who is unfamiliar with technical terms can readily understand the construction of the apparatus and the functions of various appliances used in the electrical propulsion of street cars.

It contains a vast amount of useful and valuable information for every motorman and those interested generally in Electric Railway work and improvement.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|

**NEW YORK & OHIO CO., Warren, Ohio.** TITUSVILLE, PA., March 21, 1895.

GENTLEMEN:—We send you to-day one of your PACKARD 52 volt, 16 C. P., T.-H. base lamps as a gift. This lamp has burned on the circuit of the Titusville Electric Light & Power Co. for about 7,500 hours, having been placed Oct. 18, 1893, and removed March 20, 1895. It burned all the time the plant was run, which is from about 3:30 or 4 p. m. to 8:30 or 9 a. m. in winter, and from 7 or 7:30 p. m. to 5:30 or 6 a. m. in summer; also many more hours for dark days. The voltage was taken at different times from the same socket where this lamp was burned and showed from 54 to 55 volts on a Weston Standard Voltmeter. The lamp when removed was still burning and is O. K. now. We are very well pleased with this record and would be very glad to receive best prices on this type of lamp.

Yours respectfully, (Signed) BENTON BROS.

This is the type of lamp we are making now.

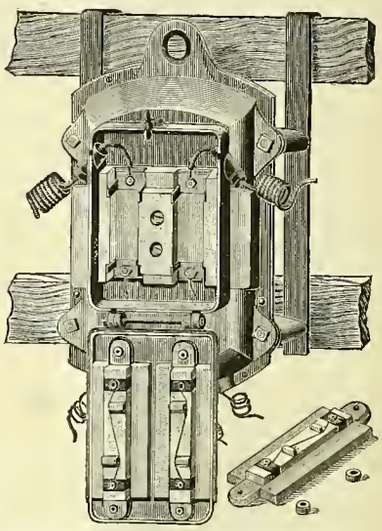
# SCHEEFFER'S RECORDING WATT-METER.

For Alternating Circuits. No Commutator. No Brushes.

Registers Direct Actual Power Consumed.

EASILY ADJUSTED. ABSOLUTELY RELIABLE.



# DIAMOND TRANSFORMER.

Simplest, Safest and Best.

FOR ANY VOLTAGE. FOR ALL SYSTEMS.

## DIAMOND ELECTRIC CO., Peoria, Ill.

Chicago Office, 1307 Manhattan Building, Central Electric Co., Selling Agents.

## Alternating Current ARC LAMPS.

# The Kester '95

**IS THE LAMP YOU HAVE HOPED FOR.**

It is the only perfected Arc Lamp for the alternator, either high or low frequency.

It comprises all that is desired in an Arc Lamp.

Write for pamphlet and prices to

## THE F. P. LITTLE Electrical Construction & Supply Company,

**135 SENECA STREET,**

**BUFFALO, N. Y.**

# Low Potential Arc Lamps.

*Alternating-Helios, Old Type.*
*Spencer, New Type.*

*Direct Current-Helios, Old Type.*
*Spencer, New Type.*

**FOR STREET, PAVEMENT AND INSIDE LIGHTING.**

Our Alternating Lamps have reflector plates. Our new Direct Current Lamps do not see-saw when running in series.

Our Focusing Lamps, both direct and alternating, are adapted for stereopticon and photo-engraving work.

We also make direct current lamps to be used on street railway circuits.

## there are no skeletons

in the **Okonite** closet—in fact, there are no closets, as there is nothing to conceal—nothing to hide away; it needs no mantle of charity to cover chance defects.

**There are no defects.** Time, with his insidious finger, has poked and pried at **Okonite** for more than a decade and fails to find a single vulnerable point, a single weak spot. Use it anywhere, for any purpose, **it never disappoints.**

**How the Saying Originated.**

It is said that the expression, "There is a skeleton in every closet," arose from the following incident: A young Italian student, finding he was dying, fearing to break the news to his mother, adopted the following device: He informed her that he was ill, and it had been foretold he would not recover until he had worn a shirt made by a woman who had no trouble. The widow soon discovered that it was no easy task to find such a person, but at length was referred to a lady who seemed surrounded with every comfort and happiness and possessing a husband who seemed devoted to her. The widow made known her request, and for an answer was shown a closet where a skeleton hung suspended from a beam. She was told it was the remains of the lady's former lover, who from motives of jealousy had been slain by her husband, and that he compelled her to visit it every day. The widow concluded that no one was without trouble, that "there was a skeleton in every closet," and became reconciled to the approaching loss of her son.—*London Answers.*

80° **what do you think** of that for a March day? and Chicago weather at that! Doesn't it seem very like **Fan Motor** weather? Our artist suggests that we picture March going out like a lamb, disappearing over the brow of a near-by hill with a **Lundell Fan Motor** in chase. It's a good suggestion, but we must leave it to your imagination this time.

We have good news for our friends of the alternating persuasion; this season we will offer a **Lundell** for alternating currents, and it is a beauty. Equal in every way to the direct current motor. The wearing parts of the two types are interchangeable.

**Now is the time to think and act.**

## Central Electric Company,

BRANCHES: { Kansas City, Mo., Gate City Electric Co.
{ St. Louis, Southern Electrical Supply Co.

**173-175 Adams St., Chicago.**

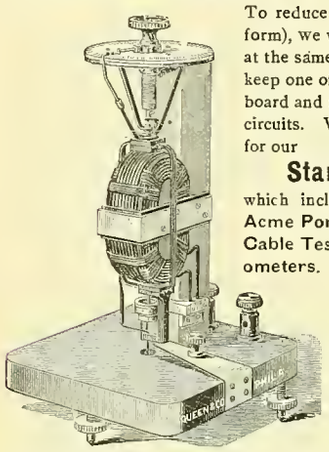
# Assignee's Sale.



To reduce our stock of **Standard Dynamometers** (enclosed form), we will sell a limited number of these instruments at the same price as our open form. Every station should keep one of these current standards as a check for switchboard and recording meters on either direct or alternating circuits. We are in a position to fill promptly all orders for our

**Standard Electrical Instruments,**

which include Magnetic Vane Volt and Ammeters, Acme Portable Voltmeters, Recording Voltmeters, Cable Testing Apparatus, Photometers and Tachometers.

Write to us before ordering elsewhere.

**QUEEN & CO., Inc.,**

New York Office, 116 Fulton Street.

**J. G. GRAY, Assignee.**

## CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.

**A Central School of Shorthand and Typewriting of the most Modern and Complete Type.**

**A COMPLETE COURSE OF SHORTHAND.** We offer you shorthand instructions in abundance, and most excellent in quality. Our course is graded and arranged in logical order. We claim not a new system, but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work. The art is made a specialty.

Tuition, $10.00 per month. Secure class seats immediately.

Evening classes, $5.00 per month. 98 per cent. of our students hold positions.

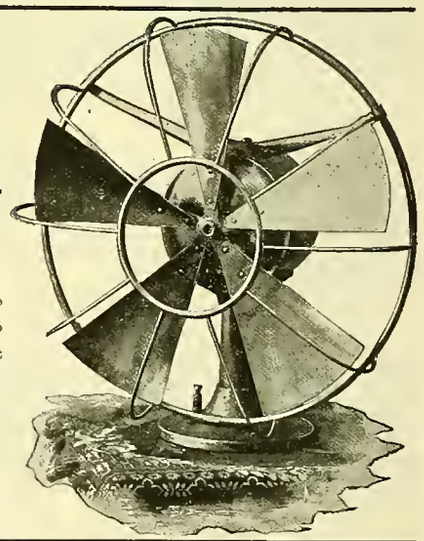
# THE BEST ELECTRIC FAN On the Market.



**For Alternating Current, Wound for 50 or 100 volts.**

The Fan is 14 inches in diameter.
Will always start when current is on
Positively self-lubricating, will run a whole season without looking after.
It is so constructed as to make it next to impossible to get out of line.
It is carefully made in every detail, almost noiseless, and does not throw sparks.

# "STRICTLY WEATHERPROOF."

WIRES AND CABLES

WIRES AND CABLES

WIRES AND CABLES

WIRES AND CABLES

WIRES AND CABLES

The necessity of a high grade weatherproof insulation that can be relied upon at all times is appreciated by every careful station manager. "O.K." weatherproof wire has a perfectly uniform insulation and every foot of it is as good as a weatherproof wire can be made.

*We sell only "O. K."*

*We, only, sell "O. K."*

## WE CARRY A LARGE STOCK IN CHICAGO.

It is not necessary for us to emphasize the fact that a low insulation resistance in your overhead line means loss of current, which is equivalent to an actual money loss.

***Prompt Shipments from Chicago.***

The purchaser who fails to specify a particular high grade of weatherproof wire is going to get the cheapest the market affords, and which will, in all probability, be weatherproof in name only. We fill all orders for weatherproof wire with our celebrated "O. K." product, and are its exclusive handlers in this territory.

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

THE

# "CLARK" WIRE.

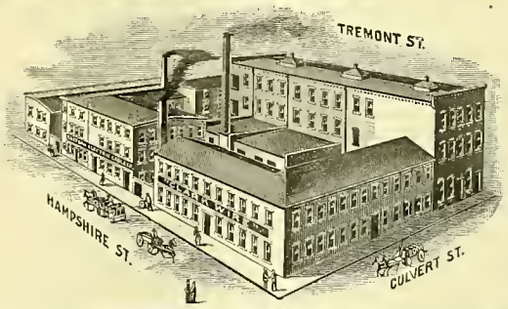
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

BRANCH OFFICE:

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

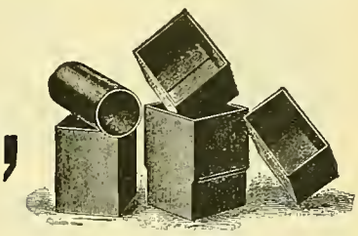
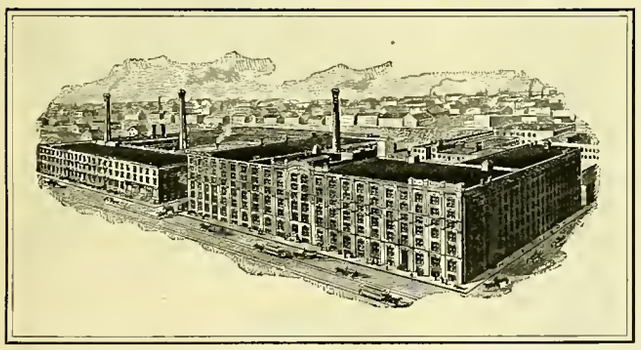
## Newton Rubber Works,



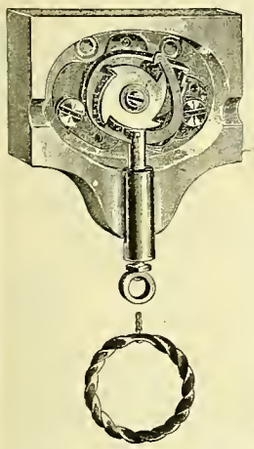
Newton Upper Falls, Mass.



List Number 947.

**BRYANT**

**Chandelier Switch.**



| | List Price. |
|---|---|
| 5 Amp., complete with 6 ft. Chain and Ring, - - - - - - each, | $1.50 |
| Extra Brass Chain, - - - per foot, | .05 |
| Extra Brass Rings, - - - each, | .05 |

This Chandelier Switch is intended to be placed in the canopy of the chandelier, and is fitted with a clamping attachment on the back which clamps around the pipe, and is held in place by a set-screw. Is rated at ten amperes. The chain can be dropped down between the pipe and the shell of the chandelier, or through a small hole in the canopy outside of the chandelier. It is fitted with brass ring hanging below the chandelier, the first pull of which lights the entire chandelier, the next pull cutting it off.

Chain and ring can be furnished in special finish where desired to match any finish or fixture.

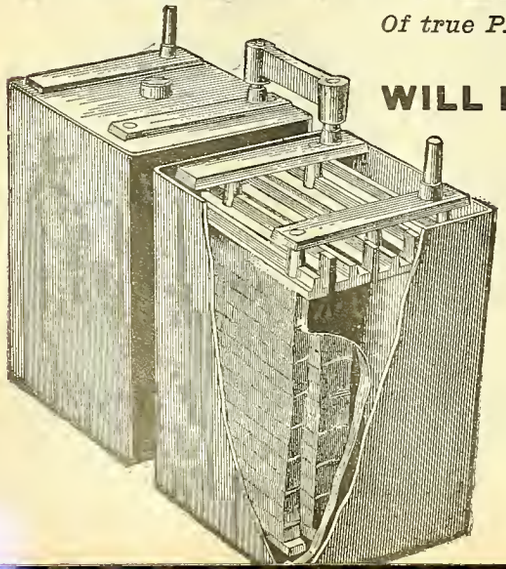
# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ **CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Becent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

THE HELIOS ELECTRIC CO. PITTSBURGH, PA.

CABLE ADDRESS, HELIOS PHILADELPHIA
CODE PLANET 5?

February, 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.

**NEW YORK & OHIO CO., Warren, Ohio.** TITUSVILLE, PA., March 21, 1895.

GENTLEMEN:—We send you to-day one of your PACKARD 52 volt, 16 C. P., T.-H. base lamps as a gift. This lamp has burned on the circuit of the Titusville Electric Light & Power Co. for about 7,600 hours, having been placed Oct. 18, 1893, and removed March 20, 1895. It burned all the time the plant was run, which is from about 3:30 or 4 p. m. to 8:30 or 9 a. m. in winter, and from 7 or 7:30 p. m. to 5:30 or 6 a. m. in summer; also many more hours for dark days. The voltage was taken at different times from the same socket where this lamp was burned and showed from 54 to 55 volts on a Weston Standard Voltmeter. The lamp when removed was still burning and is O. K. now. We are very well pleased with this record and would be very glad to receive best prices on this type of lamp.

Yours respectfully, (Signed) BENTON BROS.

This is the type of lamp we are making now.

NEW YORK & OHIO COMPANY, - - WARREN, OHIO.

TRADE E A AETNA MARK.

**Aetna Railway Insulators, Anderson Line Material,**

Manufactured solely by ALBERT & J. M. ANDERSON, 289 to 293 A Street, Boston, Mass.

Correspondence Solicited.

## PROCTOR-RAYMOND ELECTRIC CO.,

Rochester, N. Y.

# AUTO-TELEPHONE SYSTEM.

# Public Notice!

***Notice is hereby given*** that we are the ***exclusive licensee*** of the U. S. Letters Patent No. 533,729, granted to ***Thomas McCoubray***, and other patents connected with the Auto-Telephone System.

On the 28th day of February, 1895, we ***commenced suit*** against the Interior Telephone Company, of 203 Broadway, New York, and against Frank R. Colvin, its president, for the infringement of Patent No. 533,729, covering the recarbonized petroleum residuum carbon powder used in our transmitters, and to restrain the further use of the invention described and claimed in this patent, and have no fear of the result of this suit.

The Interior Telephone Company have made the following admission in speaking of the McCoubray patent: "Their patent * * * covers identically the same powder which we have used since we went into business." The Colvin transmitters now in use infringe our patent.

***We caution*** all dealers in and users of telephones against purchasing any telephonic transmitters or apparatus infringing this or other ***McCoubray*** patents, as suit will be brought against them to restrain them from selling or using such apparatus or transmitters, and for damages.

***Dealers in and users of Telephones,*** in order to avoid litigation and the consequent payment of damages, should purchase their telephonic apparatus or transmitters from us.

We are prepared to give ***any reasonable security*** to ***indemnify our customers*** in case ***suits*** should be brought against them, or we will ***even agree to take back*** the transmitters or apparatus which we sell, if they are claimed to be an infringement of any patent owned or controlled by other manufacturers than ourselves, at a fair valuation, at any time our customers shall have suit brought against them.

## CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.

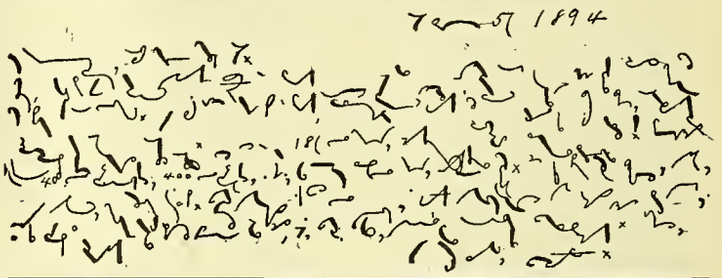
**A Central School of Shorthand and Typewriting of the most Modern and Complete Type.**

**A COMPLETE COURSE OF SHORTHAND.** We offer you shorthand instructions in abundance, and most excellent in quality. Our course is graded and arranged in logical order. We claim not a new system, but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work. The art is made a specialty.

Tuition, $10.00 per month. Secure class seats immediately.

Evening classes, $5.00 per month. 98 per cent. of our students hold positions.



# "Monarch" Insulating Material.

A hard, black composition, which is not liable to crack or break during service, or alter its form under ordinary changes of temperature. It is moulded to exact shape, and is suitable for switch-blocks, sockets, bushings, telephone bases, and other parts requiring accuracy of dimension and finish.

## TROLLEY LINE INSULATORS.

THE

# "CLARK" WIRE.

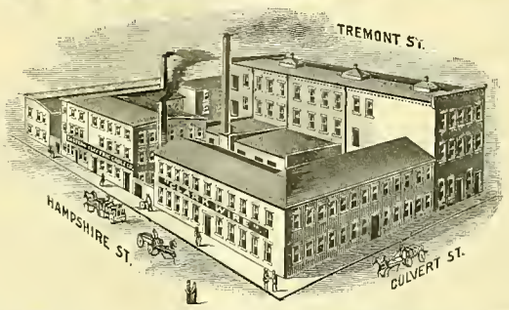
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

BRANCH OFFICE:

1649, 1650, 1651 MONADNOCK BLDG., CHICAGO, ILLINOIS.



In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# NOTICE.

*To Steam Users, and others interested in the manufacture, purchase, or use of, and sale, of Steam Boilers.*

Having been granted Letters Patent on a "Safety Water Tube Boiler," of the "type" and "class" in which the Steam and Water drums are arranged and located transversely to the flow of products of combustion in their travel from the furnace to out-take to stack, of which the "Stirling" and "Pierpoint" are examples. My patents covering, in a fundamental degree, devices and arrangements, for the maintenance of continuous circulation throughout the entire boiler system, and, it having become known to me that certain parties are offering for sale boilers of this class, for which boilers they claim such continuous circulation, it is, therefore, necessary for me to notify manufacturers, users, buyers and sellers, and those who may be acting as agents for the sale of such boilers, that the same are a direct infringement of my patents, which it is my purpose to protect to the utmost extent. at the same time to guarantee to all purchasers of my Boilers the fullest protection against claims or litigation on the part of any and all patentees of Water Tube Boilers.

# PROPOSALS.

The city of Knoxville, Tennessee, is about to install its own light plant. Its light committee invites persons or firms dealing in electric lighting machinery and electrical supplies to correspond with them in reference to the immediate installation of an up-to-date electric light plant of not less capacity than 250 arc lamps of standard candle power.

J. R. WADE, Chairman.

# Proposals.

Notice is hereby given to all electric light companies supplying light to cities, that the contract by which the city of Johnstown, Pa., is now lighted will expire in September, 1895, and the councils of the city of Johnstown hereby invite proposals for the furnishing of light to the city for a term of three or five years. About two hundred (2,000 candle power) arc lamps will be required. The right of way over and through the streets and alleys will be granted for the erection of poles A plant can be centrally located and supplied with coal at less than one dollar per ton. All communications to be addressed to JNO. J. BROWN,

City Controller. JOHNSTOWN, PA.

## CHANDELIER SWITCH.

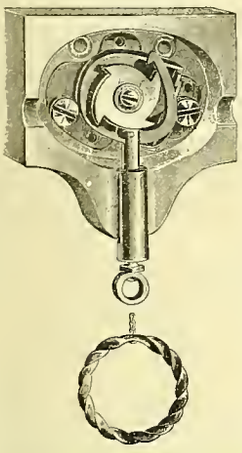
**ONE Pull Lights the Entire Chandelier.**
**The NEXT Pull Puts it Out.**

*Buy a* **SAMPLE** *and you will buy* **MORE.**

IN STOCK AT NEW YORK AND CHICAGO.

List Number 947.

**BRYANT**
**Chandelier Switch.**



| | List Price. |
|---|---|
| 5 Amp., complete with 6 ft. Chain and Ring, - - - - - - each, | **$1.50** |
| Extra Brass Chain, - - - per foot, | **.05** |
| Extra Brass Rings, - - - each, | **.05** |

This Chandelier Switch is intended to be placed in the canopy of the chandelier, and is fitted with a clamping attachment on the back which clamps around the pipe, and is held in place by a set-screw. Is rated at ten amperes. The chain can be dropped down between the pipe and the shell of the chandelier, or through a small hole in the canopy outside of the chandelier. It is fitted with brass ring hanging below the chandelier, the first pull of which lights the entire chandelier, the next pull cutting it off.

Chain and ring can be furnished to special finish where desired to match any finish or fixture.

THE HELIOS ELECTRIC CO. PHILADELPHIA, PA.
CABLE ADDRESS, HELIOS PHILADELPHIA
ORO FILBERT ST

February, 12th, 1895.

The Washington Carbon Co.,
Pittsburgh, Pa.

Gentlemen:

We beg to say in answer to your inquiry that we have thoroughly tested the Helios cored carbons manufactured by your company, and we find them equal in every respect to the imported Helios carbons, and vastly superior to any other cored carbon made, either domestic or imported.

We congratulate you upon your success.

Yours truly,
HELIOS ELECTRIC CO.
Thos. Spencer
Sup't.

In the words of Chas. Bradshaw, the superior quality of our **Helios Cored Carbons** is a fact which **"Reason Perceives, Experiment verifies** and **Experience Confirms."**

**HELIOS CORED CARBONS**

# THE TESLA PATENTS!

## Broadly Covering the Manufacture, Sale and Use of Alternating Polyphase Power Machinery,

**ARE OWNED AND CONTROLLED BY**

# WESTINGHOUSE ELECTRIC & MANUF'G COMPANY,

PITTSBURG, PENNSYLVANIA.

We manufacture a full line of Polyphase Generators and Motors for long and short distance transmission and for the distribution of power by polyphase alternating currents. The perfection to which these systems have been brought is the electrical achievement of the century. Distant water powers are made commercially available in the large centers of population.

We invite all interested to visit our large new factories at East Pittsburg, Pa., to inspect the polyphase power plant by which they are operated and the methods of construction employed; also to communicate with the many independent installations throughout the country.

Multiphase or polyphase motors, including the so-called "Monocyclic" variety, are covered by Nikola Tesla's patents owned by this company. Suits have already been brought against the General Electric Company and Stanley Electric Manufacturing Company, and it is the intention of this company to enforce its rights against all infringers.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Stockman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Why not get the best?

1888. 1895.

Give us trial order.

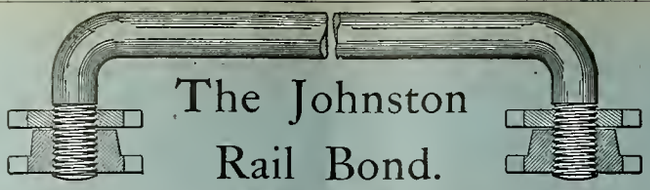
EDGERTON POTTERY CO., EDGERTON, WIS.

--CUPS

**$24.00 SPECIAL**

To introduce our Dynamos and Motors of larger capacity, we are making a specialty of a high-grade 8-light, 16 C. P., 110 volt Dynamo, retaining all the special features of our larger machines at a surprising low price. Send for circular No. 22.

**ROTH & ECK**, Manufacturers Dynamos and Motors, 84 Market St., Chicago.



# The Johnston Rail Bond.

(Patented July 17, 1894.)

For electrical contact both sides of the rail are used. The nuts have twelve times the cross-section of the copper conducting rod. Under the nuts the rail is smoothed and brightened by a special tool. The nuts are also, smooth and bright.

A firm mechanical, electrical and water-tight joint is made.

The usual length is 30 inches, of 00 and 0000 copper rod.

Address the manufacturers,

John A. Roebling's Sons Co.,

New York. Chicago. San Francisco. TRENTON, N. J

# HELMET OIL

USED BY THE BEST ENGINEERS: THEY INSIST ON HAVING IT — THE CHEAPEST LUBRICANT KNOWN:— PUREST AND BEST FOR ALL KINDS OF MACHINERY.
